Aside from simply reminiscing, your mention of 'tabify' in context of distinguishing features in the development environments strikes me as belonging in this vein. Shirley you must be yoking! This can't be the result of any thoughtful tour of features. All kidding aside, you owe yourself a better look. Find someone who really believes in the tool, and have her show you what it can really do. The tool integration is superb, bar none, with coverage that doesn't leave much wanting.

Anyway, if yours doesn't build ATL COM objects, it isn't really a
development system. Is it?

> I can quite appreciate why a radio amateur would not want to use a 'kit form' operating system, preferring instead a shiny 'black box' style OS with lots of bells and whistles, but that is no good reason to dismiss those who pull together and make their own software in their own time any more than those who do likewise with hardware in amateur radio.

I was skeptical at first, but have to agree on the parallel. Linux as a kit-form OS is a myth. For the majority, it might mean struggling with install scripts. It's a rare bird who actually builds a kernel for himself. Even there, you follow the prompts, much as you might check off construction steps in a kit. Neither task requires much high level thinking to accomplish. You didn't learn much about OS'es and computers, and you didn't necessarily learn anything about how a radio works. You might learn a thing or two about component insertion and soldering, though.

Tinkering together small software is akin to wiring up a tuna tin II from scratch. Both are larger accomplishments, and worthy of some sense of personal achievement. The parallel still holds true. The tuna tin might pull a few Q's, but even the simplest kit rig works far better. Even so, even the best kits fall far short of the standards set by even the lowliest of the mainstream "black boxes".

It's a very rare person who can modify the kernel to work with his homebrew modem, for example, perhaps as rare as the person who can conceive and manhattan a better detector section for his K2. We're not in awe of these accomplishments, since the perpetrator likely does something related for a living anyway. And so the parallel holds still true.

Coming up empty both here and in a google search, I presume that there isn't one. The Compaq iPaq has built-in audio, and seems an ideal companion for the tiny psk-only rigs. I guess I can take a shot at building the software...

I believe you are right. That's why I refer to Linux as a learning tool.

>
> I can quite appreciate why a radio amateur would not want to use a

I do not dismiss them, but on the other hand I do not pretend that those
efforts can in any way compare with the real thing. When my son was five, we
all enjoyed his finger-paintings, and hung them up on the refrigerator.
These Linux bots expect us to hang their "finger paintings" up in the museum
of fine art, shoving a few Monets and Rubens off into a dusty store room
somewhere in the back.

They are not just stupid, they are uncultured barbarians.

>
> > Professional programmers know better.

Last I looked (6 months ago perhaps) it was still missing sem() and shmem().

Was looking into the possibility of porting some code from Solaris that relied on semaphores and shared memory ...

I have nothing at all against Linux. "It's just another Unix".

I wonder where you looked?

Shared memory and Sys.V-style semaphores have been in place
since (at least) 1993.

I guess Posix (1003.1b) semaphores came somewhat later, but it's
there now (as part of the LinuxThreads library).

In comp.os.linux.networking Michael Young <mikewhy@my-deja.com> wrote:

> In the months leading up to the public release of NT 3.1, I had many long
> heated discussions with windows-phobes on how NT really was an operating
> system despite not being UNIX. One common thread was the laundry list of
> features that all OS's must support, but NT does not.

Despite my being a Unix snob, I would certainly not have had this argument with you. The design of NT certainly makes it a "real OS", and I don't harbor any illusions that Unix systems are the only real OSes. There were many fine OSes in those days: VMS, Tops-10, MVS, ... OTOH, when NT came out, the OSes on PC-class machines were Windows 3.x, DOS, and MacOS (if you don't look at the PC Unix versions, which came up a bit short), and all of those are definitely toys and not "real OSes" by almost any definition (nor would I call Windows 9x a real OS). But the design of NT held great promise (as did the design of OS/2, incidentally), but the implementation has been a little disappointing (although not as horrible as it could have been).

I've got Windows 2000 Professional installed on my laptop (along with Linux), and it is pretty slick. However, there are obviously still some issues because it can hang and freeze the machine on a somewhat regular basis. Funny how that never has happened under Linux, even though I use it about 10x as much....

> Aside from simply reminiscing, your mention of 'tabify' in context of distinguishing features in the development environments strikes me as belonging in this vein. Shirley you must be yoking! This can't be the result of any thoughtful tour of features. All kidding aside, you owe yourself a better look. Find someone who really believes in the tool, and have her show you what it can really do. The tool integration is superb, bar none, with coverage that doesn't leave much wanting.

The mention of "tabify" didn't really have anything to do with a meaningful "tour of features". In fact, while I have used tabify/untabify in the past, I don't consider that a particularly vital feature (although I suppose if you use non-standard tab widths like the default Visual Studio configuration, it could be extremely useful!) -- it was the *name* and the fact that it was obviously taken directly out of emacs that was the point. Visual Studio does have some great features, but my point is that it has many of those good features because it has copied many features from existing systems -- including the Unix/Linux tools that were being disparaged here. So the point is that if the Unix/Linux tools are so horrible, why is Microsoft copying features from them? Trying to play catch-up perhaps?

> Anyway, if yours doesn't build ATL COM objects, it isn't really a development system. Is it?

Heh.

```

Posix was what was needed, and I'm glad to hear the Threads library
is now working ... wasn't when I checked.

When it would have expanded C:\ to file://C|/ one could have believed that
something clever was being done...   expanding // to file:// is not helping
anyone.

(of course one wonders why there is no deluge of lawsuits against MS,
considering the amount of damages done to the world by OE...  a car
manufacturer or hamburger restaurant would have been sued to bankrupcy when
releasing a product like this)

Rob

Off subject, but another good reason why to promote things other than Microsoft.

Just watched TechTV at lunch and the lead story is Microsoft has announced that MSN will no longer allow any email client other then Microsoft Outlook and Outlook Express to use MSN email service. Siting anti-spam as the reason for this, Eudora and any other non-Microsoft mail client will no longer be supported, or allowed access, as Microsoft will discontinue port 25 POP/SMTP access.

Looks to me like another "squash the competition" 600 pound gorilla action by Microsoft. Just like the did they browser competitors.

To paraphrase Ken Star, who TechTV interviewed, it was business as usual at Microsoft. Do anything they have to and can do to make all computer users need and rely on Microsoft products. He continued stating that this is another reason to contiue the anti-trust action.

Copying features such as keyboard text entry? shelling a compiler with a few keystrokes? smart-indents? You can think of them as emacs features; I think of them as good, commonsense programmer tools. All of them pre-date emacs, in fact. Come to think of it, even the emacs implementations are not really part of emacs. IOW: they would have happened without emacs. Emacs just happened to be the first with a powerful enough macro language to allow its implementation. As for some incidental names, I would guess Stallman borrowed 'tabify' from Plaugher's pascal book. Or was that Kernighan's C book? One or the other, maybe even both.

See how much fun we're having? OS wars were fun, not because OSes are fun, but because other people's prejudices are fun.

Anyway, my other point was probably missed. Visual Studio really does take tools and integration to a higher level. The whole really is much, much larger than the mere sum of the individual parts and features. Forget my hyperbole; have someone you trust tell you about it.

As for disparaging other tools and environments: I haven't the time, energy, or even the inclination. I feel something more akin to pity than disdain for those struggling along with less. If I'm knocking your system with words, it's only because I'm having a bit of fun, possibly at your expense.

Mike.

So this is really an "Is it art?" debate is it?

We're not uncultured, we're just promoting a culture you don't
understand.

I suspect your objections to Linux are based mostly on your own
personal sense of aesthetic, one that we don't have to share.

We're all free to choose, no?

Terry

I was meaning more from the perspective of how you address a particular service at a particular host. Sockets facilitate any individual host running multiple applications with the multiplexing handled at transport layer.

So you'd want to introduce some sort of transport/session management functionality as well, that's reasonable of course, so long as there is a way to do it that doesn't have dependencies on either the underlying protocol or that interferes with the application in question.

> So who wants to play?

I have a PTC-II, an IC-706 and a 20m dipole sitting here doing nothing because there appears to be nothing of interest happening on PACTOR other than BBS forwarding and the occasional packet radio gateway .. so I'm potentially interested. I'll warn you now though, I'm seriously time limited so whatever I do I'll do slowly :)

regards
Terry

That's the point I made. Since the concept of a subchannel (socket number or port id etc.) does not exist in those two protocols, one has to do things differently. Single stream, so it's one circuit at a time, and that circuit can run whatever protocol you want. Running multiple subchannels is certainly possible (have done that) but takes a lot more code, the code is more complex, and the data rate is kinda slow.

> So you'd want to introduce some sort of transport/session management

The application doesn't care. It sees an ip connection to the appropriate socket. It's the network shim that takes care of the details. I choose to run that layer on a separate box, so it can live with the radios it controls. Any old junker 386 or better works fine. Then the Windows or Linux box just sees things as normal tcp/ip (possibly with that only-one-circuit limitation). In many ways no different than PPP (and one could use PPP I suppose).

Well ... that's all you get with smtp/pop/nntp/ftp. Same stuff exactly as the existing BBS network, just different protocols to carry the data.

I don't think http makes much sense via PACTOR/CLOVER.

Have only CLOVER here, no PACTOR.

I'd be looking for someone who could dedicate an hour or two per day for a few weeks to testing.

Maybe someone else is interested ...

OK, today I wired up an 8-pin DIN to 5-pin DIN cable to connect my Icom
IC-706MKIIG
transceiver and my MFJ-1274 TNC, using the pinouts located in the
manuals, and checking
the cable several times with a continuity checker.

Now for the moment of truth. I connect the radio to the TNC, and find
that the packets,
which can be heard clearly in the receiver, for some reason are not
making it to the TNC.
No indicators (DCD, tuning indicator) light up and no output is sent to
the computer.

Transmitting doesn't seem to be a problem at all, though (the TNC has no
problem keying

the transceiver, and sending out a packet into it. I can hear these
packets just fine on a
nearby scanner)

The TNC itself seems to be ok; I have another cable that allows me to
feed just the audio input
from the transceiver's phone jack into the TNC. If I do that, the TNC
decodes the packets
and displays them onscreen.

The radio, and TNC, have both been set to 1200 Baud (for use on
2-meters)

The only thing I can think of is that the output from the Icom's TNC
connector
is too low to be read reliably by the TNC. (Or was there some secret
switch or
setting that I forgot to adjust?)

Well anyway, thanks in advance!

You've surely overlooked something then.
Semaphores and Shared Memory have been standard features of the Linux kernel since 1992.

regards
Terry

Hi there fellow warblers... MixW version 2.0 RC9 has now been uploaded to
our website which is:
http://www.nvbb.net/~jaffejim/mixwpage.htm the following changes and updates

have been made:
- Expiration date (for unregistered users) is . August 1st 2001 Now
Supporting Dual Callsigns
For Registered Users (Must be at same address or MARS Callsign)
Added:
RC9 main changes:
- CW Old MixW 1.45 alg added
- SSTV Picture Preview in load picture dialog
- SSTV Tx load history tab
- TUNE transmitter menu item
- NEW MACROS
<WPM:nn> <WPM+nn> <WPM-nn> - for CW, absolute and relative speed change
<WPM:RX> Make TX speed equal to RX
<LOADPICTURE:filename> - if folder(directory) is on the place of
filename, RANDOM picture from that folder will be loaded.
<TUNE> - start tuning tone
<STOP> and <ESCAPE> - equivalence of keyboard Escape
- TEN-TEC PEGASUS support via external file (external PEGASUS control
software is required.
- SoundCard driver mode (Usual/DirectX) option is added.

Hi there,

I am looking for infos on the computer command data of a FT 757. Can anybody help, may be by offering photocopies of the respective manual pages?

Please mail to roland.burkhard@ascom.ch

Thanks and regards

Roland, HB9BQR

Sure, Hank, gcc is not without warts, but it is a far cry from a "joke". However, the difference between gcc and many "reference" compilers is not as broad as you might suggest; certainly, Intel has invested a fair bit of cash in IA-64 for gcc, and gcc was well-supported for the i960 family.

I know of a number of modules shipped in real products built with gcc.

Again, sure, but few people that I've encountered in the last decade are much concerned about extreme optimization, particularly since CPUs have become considerably faster. In fact, the time/effort required to optimize compilers is often not justified when one can simply wait 6 months and get a new CPU that sports a much greater performance increase than any optimizer enhancement could provide.

GCC is an unmitigated success story, no two ways about it.

In general, I agree with you Hank, most open source projects require at least
one development expert to be available, however, specifically for Apache, I believe you're exagerating or perhaps basing your comment on a much older release of the server.

IBM, Sun and others have been actively supporting Apache for several years, and the stability of the server has been considered outstanding for at least as
long.

Again, I'm not disagreeing with you in general, but I am specifically pointing out that the most successful of the Open Source projects have garnered enough commercial productization support that they're fairly well-supported.

Hardware makers have been the primary corporate sponsors of open source software, really; though the Linux start-ups have invested a fair bit, they're not behind the increased perception of quality.

Well, it's a science fair project that the students have largely lost

interest in. Speaking as someone that's built a thing or two for amateur networking (a streams AX.25 driver for Solaris, a Java implementation of AX.25 as part of an ARESDATA-type server, to mention the more interesting things), I'm not on fire to spend much effort in the realm.

I'm a little intrigued at the thought of a publish-subscribe/reliable multicast implementation on top of APRS messaging, but haven't done much with it. I suspect I'd be the only user of it.

I think Apache is over-rated. I don't like it because I spend hours reading documentation and cryptic programmer notes.

On top of that, Oracle uses it now with their database server, so I get to hate it even more (as a sysadmin).

For me, I'm a Roxen fan (www.roxen.com). I've used it from version 1.3 (now at 2.2) and while it has poor documentation, there is no manual config file. You set up virtual server and global parameters using a GUI web page. Constructs are available to interact with the

Mysql (or Oracle, or popular) database, and maintain security.

AX.25, like X.25, is a dead duck. It's a protocol that had a chance,
and is now dead. I think that most of the people involved in creating
it are dead, or too old to lift their beer by themselves.

I wouldn't waste any more time on it than I would on the CP/M
emulator :-) All of it was done by one or two people, and did not have
the (often) hundreds of people that NOS had, pimping the code.
You can tell, because NOS has about 750 copyrights comparably :-)

I just got an eval kit for the MX-919B modem chip (MAC level,
with FEC). This is the chip used by the largest packet radio
network in the states--police and fire.

Please, no more netrom!

Steve, if you have a proposal for replacing AX.25 and NET/ROM,
post that proposal here. Then we can comment on it.

It would probably be better to have an IP autorouter that uses techniques and timings suitable to packet radio. Users would feed the IP packets (out of their off-the-shelf standard applications on their Windows or Linux boxes) into a local node, and the node would route them like an ISP would route their Internet traffic.

It could use a standard Internet routing protocol, but it would be better to consider the facts of life on packet (uni-directional routes, or at least independent route quality measurements in both directions; automatic selection of VC mode when required for reliability; timing adapted to the link speed; etc)

Rob

How does that compare to current TCP/IP packet technology?

It would mean no manual IP routes are required anymore, and the routing
would adapt to changes in the topology just like it does with NET/ROM or
Flexnet.

Rob

For the same price as Apache, Roxen is a task simplifier, and easy.
Why go for hard. You aren't going to impress anyone. After all,
it's just a server of web data.

Actually, I should say I'm not really interested in routing protocols, as
my application is the integration of voice, GPS data, and pager type
data into a digital stream (for hobbyist purposes), and while I enjoy
a Samuel Adams every now and then, I've currently been having an
affair with distilled products.

Not as worse as CC (Solaris), aCC (HPUX) or xlC (AIX) are right now.
And g++ in 2.95.2 was already good enough for me.

Just my 2 Cent,
Uli

SNOS has the start of some of these features.

I'm playing with ARP eavesdropping (nothing new about that),
RIP eavesdropping, SYN/ACK snooping and some other
techniques for host and route discovery. There are not enough
hosts in our network (20-25) to make experimentation easy.

It should not be too surprising that what works is very much like
the way NET/ROM does it ... and of course the snooping techniques
work for AX.25 L2 stations as well as IP.

The basic ideas were discussed as early as 1985 with respect to
the TAPR NNC and other pre-NET/ROM AX.25 Layer 3/4 extensions.

My own experience with Apache differs from yours.
I found it simple to set up and maintain, very robust, and quite fast.

So why do you hate it "more" because Oracle chose it?

Um ... MAC layer is L1 ... you talked about NET/ROM which is L3/L4.
So what do you propose at L2? AX.25? IP?
At L3/L4? TCP?

To drift the thread a bit ... why don't we use POP and SMTP over AX.25
(and PACTOR and CLOVER and ...)?

I realize you probably posted this just to provoke a reaction, but assuming you actually believe at least some of what you say....

So people don't use C++ in Linux? Hmmm... perhaps you should tell the KDE people that -- they've written huge amounts of C++ code, millions of lines of code in fact, that run quite well under Linux.

...

> You can write standard Antsy C code with any of the C++ compilers, of
> course, - but when you need all that gui stuff, it's in there there waiting
> for you.

Ah... thanks for bringing up ANSI ("Antsy"???) and standards. I suppose if you define a good compiler as one that works like Visual C++ then you have a point about g++, but that's pretty circular reasoning. Visual C++ still doesn't do some very basic things in a standards-compliant way (like variable scoping with a for loop, for example -- hell, g++ and Borland both had that one right years ago), so I'm thankful every day that I don't have to use Visual C++ often.

And since you seem so taken with the GUI, let's talk about the editors in Visual C++ and Borland. Lame, lame, lame. Fortunately, they're so bad that it gives rise to a whole industry of people who write better editors. Codewright (I think that's the right name) actually looks good, but do you really want to spend $300 extra dollars for an editor after shelling out bucks for the development environment? And none of these hold a candle to emacs under Linux (actually, a lot of people use the Windows port of emacs, so at least you're not totally out of luck there).

That's not what I said. I said it was over-rated, as my use of Roxen showed it to be featureless in comparison. Here's a sample of what I mean:

```
<tablify nicer size=1 grid=1>
Time (Zulu) From To Path Undecoded Data
```

```
<sqltable ascii host=aprs-read
query="select ftime,ffrom,fto,fpath,fdata from frame
where date_add(now()+0,interval +5 hour)-ftime < 1000
order by ftime">
</tablify>
```

Which produces one of those blue and white grids with data
filled in from the database. Notice that no database password
information is released, only a reference name of "aprs-read".

To do the same thing in Apache you would need an add-on
from another open-source group. More learning curve.

> > Oracle iAS uses Apache.
>
> So why do you hate it "more" because Oracle chose it?

It's a midwest phrase. If you don't like something, then you get to
"hate it even more" if you are forced to use it to make another
product work.

> Um ... MAC layer is L1 ... you talked about NET/ROM which is L3/L4.

The AMBE-2000 chip (www.dvsinc.com) works down to 2000 baud,
and it doesn't sound bad. 4800 baud sounds really good (toll-quality).

Let's get this correctly stated.  I've included the other levels for reference.

Hardware is layer 1 (electrical and signal timing characteristics).
Soft/firmware and data encoding is layer 2.
IP is layer 3 (switching/routing).
TCP is layer 4 (transport).
Session management is layer 5.
Presentation management is layer 6.
Application management is layer 7.

I understood what Hank meant, as you need a protocol layer on top of
the modem, and why not AX.25? One reason may be, that it (AX.25/
HDLC) is designed for direct modem drive. This modified HDLC with
bit stuffing, address bit shifting, etc, may interfere (add without gain)
with FEC/block interleaving type modem chips.

>SNOS has the start of some of these features.

Many pieces of software have the start of some of these features!

JNOS does.  NETCHL does.

But a start of features does not cut it.

What we would need to have it operational is:

- a better protocol, that will perform in the typical cases encountered
  in amateur radio (like flaky links, links that are good in one direction
  and bad in the other, links that are OK when idle and collapse as soon
  as you load them, etc)

- a reference implementation that is open and independent enough from the
  underlying architecture to be ported to the different platforms and
  software packages already running
  (most people will not be prepared to switch to a completely different
  system overnight, so it must co-exist)

- some application-layer services that will show that IP based routing
  can provide the same functionality as NET/ROM or Flexnet to the end
  user (i.e. present some user interface to someone who connects with
  AX.25 and allow them to "connect through the system" without seeing that
  the actual traffic is TCP/IP and without noticing that the system does
```

not do hop-by-hop connects but lets the command interpreter run at the
local node all the time and just sends directions through the network).
also allow any AX.25 packet with any PID to pass through the network,
tunneled in IP, so the network can transparently be used for any other
traffic.

Once the lower layer is all IP, we can finally start dropping AX.25 as
the mandatory link protocol on each and every link and user access, and
evaluate other protocols on a case-by-case basis.

Oh, what you want is all-in-one-from-a-single-vendor?
Without any need for add-ons?

In that case I would advise you to go for Microsoft. They
will provide everything you need.

Why do you use Oracle, not SQL Server? It is another add-on
with a steep learning curve.

Get real. Last week I was looking at the aftermarket gui's available for Borland's givaway command-line version of C++ Builder. Lame, lame, lame. None of them approached the general utility of the gui interface in Visual Basic 4.0, for example. - And they sure as heck did not measure up to the new stuff Borland and Microsoft are offering.

You must be a Linux enthusiast. To my knowlege, only Linux enthusiasts are willing to settle for substandard, third-rate software and while using it, claim it's "better" than the professionally written stuff that people who are serious about programming are ready, willing, and able to pay for because they know that they will significantly increase their productivity.

Too bad you are full of crap. Lots of people would be happy if there were any reality to back up your claims, but unfortunately....   ;-)

Name a single editor -- *any* editor, commercial or free -- that comes
anywhere close to the power and feature set of emacs. The one built
in to the Visual C++ editor is particulary horrendous. It tries to
re-set standard tab sizes (you can fortunately re-set this through
options), has no intelligent re-indenting of code, horrible text
searching capabilities (I would be amazed at a programmer's editor
that doesn't do regular expression searching, but then again a lot of
people who write code for Windows aren't really trained as programmers
and probably don't even know what regular expressions are!), no simple
editor macro facility, no way to program it to automate repitious
tasks easily, ... these are feature that I use almost constantly when
programming, but aren't available in Visual C++ -- how do you people
ever get any actual coding done???

> You must be a Linux enthusiast. To my knowlege, only Linux enthusiasts are

Yep, I'm a Linux enthusiast (on a Linux newsgroup! imagine that!).
But I'm a Linux enthusiast because the quality of the software is
better -- I'll use whatever tool is best for the job. When I have
to constantly fight with the Windows environment, or have things
simply work correctly under Linux, I'd be a fool *not* to be a Linux

enthusiast. So as far as my productivity, it takes a huge dive everytime I have to use Windows...

> Too bad you are full of crap. Lots of people would be happy if there were
> any reality to back up your claims, but unfortunately.... ;-)

Actually, I have backed up my claims. See above for things that are missing from the basic Visual C++ editor (we can start on debugger features next, if you'd like -- Visual C++ is pretty weak there too). You on the other hand have provided absolutely no concrete facts other than raving about "Linux enthusiasts".

There -- you've got the argument you were looking for now. Happy?

Well ... I have a bit more than a "start" actually.
Quite a bit of it is working, but is in alpha (buggy) state right now.
So it does not appear in the "release" version of SNOS.
JNOS has nothing at all, other than some ARP snooping.
What is worse, JNOS can not handle RIP via tunnel (NET/ROM e.g.)

I'm not yet convinced a new protocol is needed to handle these things.
Different behavior of the existing protocols may suffice.

> - a reference implementation that is open and independent enough from the

A lot of work, and history shows us this will not happen in the ham radio world.
We don't even have a reference implementation for AX.25, much
less NET/ROM or FlexNet.
In my opinion an RFC is better, and is required anyway.

Exactly. But see below.

> Once the lower layer is all IP, we can finally start dropping AX.25 as
> the mandatory link protocol on each and every link and user access, and

I guess, if you assume the goal is to use IP. Many of my links do not
use AX.25, but use other protocols. So I tend to look at IP as a way
to unify things at the application layer, and do whatever makes sense
at the lower layers. IP makes little sense over slow HF links, for example.

Not convinced IP can do what is is needed at L2, at least for some
of the applications of interest (e.g. HF bulk transport).

The protocol stack I'm working with has Layer 2 split into several
sublayers (as does AX.25) to make a clear interface between the
transport issues and access to the Layer 1 parameters that need
"input from what you learn at Layer 2 and above".

Exactly.
PACTOR works, CLOVER works, AX.25 works, etc.

A lot of the issues involve exactly where you decide to put error detection and recovery, packet sequencing, RF link parameter adjustment (power control, txd, clover physical frame size and FEC overhead, signalling mode and rate, chip size, etc.)

The serious issue is a way to maintain backward compatibility. Makes everything a tad more difficult.

Well ... the RFCs do not require tcp/ip.
These are simple text based protocols, and run fine over any transparent link.
Ditto FTP/HTTP/your-favorite-one-here.

Pretty clearly, legacy support protocol support is not a serious issue. Most amateur packet usage today appears to be APRS, there's far less interest in general networks than there was 10 years ago. At this point, the cost of legacy support brings few benefits, and the proper approach is, IMHO, to build gateways where needed but otherwise discard the well-intentioned concept of legacy-support.

I'm serious. Any new effort should absolutely start fresh, retaining the lessons learned and knowledge gained, but not be hampered by legacy support. At the hardware level, we have a lot of 1200 baud packet gear floating around, so there's a pretty good reason to maintain MAC-level compatibility, but software protocols are easily replaced.

The waning popularity of packet radio is giving us a chance at a fresh start.

I am running a 718 on PSK31 and it works just fine. I do not have any of the add on filters installed and if I did, I probably wouldn't be using it on PSK31.

The rig does get pretty hot though!

I am using Digipan 1.6d software with the Digipan interface.

This interface uses pin 7 from the serial port to T/R switch. My problem is
that this pin is always at + voltage. My thoughts were that this pin would
be at - voltage normally and switched to + by the software to key the rig.
Anyone have any ideas on this.

Meanwhile, I have rigged in a toggle switch for manual T/R and warble along.

That's how it should work. Are you sure that you have the proper com
port selected in DigiPan? Are there any other programs running (such
as Palm Pilots hot sync) that may be taking over the serial port?

Bob,

Thanks for the help. You nailed it.

I installed a Palm IIIc on this computer a couple of months ago and then
took it to work and installed it there. I un-installed the Palm software
and re-booted. It now T/R keys the rig as expected through the serial
cable.

Again thanks.

Hello OM,

Our proyect is to link two computers with this configuration:

-> MSDOS , DOS FBB, FLEXNET, 3COM ETHERNET CARD

-> WIN98, WINFBB, FLEXNET, 3COM ETHERNET CARD

Both ethernet cards are link by a cross cable RJ45.

Documentation of flexnet seems not to be very clear with this configuration.

Wich are the flexnet drivers we must use to make it running ? (in both computers)

Thanks for your help

Not sure what you mean. The FlexNet package that allows this is named
FLEX95IP.LZH, and like all the FlexNet modules, it is available at the
FlexNet groups' website, on the downloads page.

I've been mildly curious about this for years, sounds interesting.
Unfortunately, I haven't yet found anybody else interested in it, and don't
see much purpose in running it without another Ham to "talk to". Maybe
you'll have better luck. It's been around for years, I've heard Hams from
Europe talking about using it, but have never installed or operated it
myself. I run the Win95 version of FlexNet, but without this module.

The applications it allows use of, are the regular old Windows tcpip
applications, Internet Explorer, Outlook Express, WS-FTP, and so on.

I've never heard of anybody here in the US running it. Over here, it's
always *NOS in a Linux box, with a serial or ethernet link to a DOS FlexNet
Box that handles the radios.

Maybe there's some function that FLEX95IP doesn't provide, that Hams over
here are used to having with *NOS. Beats me! I've always thought of Amateur
TCPIP as a lot of extra trouble for very little return, so my curiosity
about it has not been high.

I don't really follow you here either. (I just woke up) I can see why
someone would want to use their HF rig to operate PACTOR or CLOVER, but

don't see the advantage of doing it all over AX25.

There is a setting in the Palm hot sync software that will cause it to only take over the serial port when you run the program. With the default setting it is looking at the serial port all the time so it knows when you plug the Palm into the cradle. If you turn this feature off then it only looks when you actually run the program. You can have both DigiPan and your Palm - one at a time.

Where did tcp/ip come from in this discussion?

My suggestion was to run the text based protocol suite across
AX.25, PACTOR and CLOVER.

TCP/IP does not enter into the discussion.

Of course you can run any tcp/ip based protocol across AX.25,
people have been doing that since 1985.

You are full of it Charles.

There have been substantial improvements to G++ in the past year or two.
Well done to the team. The latest version of the GCC suite (3.0) is
just out and has a lot more C++ enhancements I heard.

> You can write standard Antsy C code with any of the C++ compilers, of

You do know that a C++ and ANSI C aren't completely compatible, right?
A C++ compiler is not substitute for an ANSI C compiler.

> Lately though, I've become interested in working with embedded PC's, and

Guess what Charles, it won't run Windows well.

Wow, what an EXCELLENT reason for using Apache!

Hamish

What's an excellent reason? Each product stands on its own. I also
like Roxen, and would use Apache only if someone paid me to.

PLEASE HELP! My radio has a very fatiguing, stairstep tuning feel-- not the smooth analog feel it should have when tuning up and down. It's like the tuning resolution is only 50Hz, instead of 1 Hz. This radio was sent to Yaesu several years ago because the 2nd LO went out. It has been like this ever since I received it back from Yaesu, but never did anything about it! Anyone familiar with these LO circuits in this radio? Also, the FM mode doesn't work-- no white noise on RX, very quite. Any help would be appreciated...
Thanks,
Prentice, N4VBH

| You are full of it Charles.
|
| There have been substantial improvements to G++ in the past year or two.
| Well done to the team. The latest version of the GCC suite (3.0) is
| just out and has a lot more C++ enhancements I heard.

GCC 3.0 has been out for a few weeks, finally getting most of the minor points cleared up and you disagree that the C++ has been problimatical? Of course "a joke" is a vast exageration as well, but the list of fixes and features for 3.0 is large enough to justify some caution in using it for embedded applications previously.

| > You can write standard Antsy C code with any of the C++ compilers, of
|
| You do know that a C++ and ANSI C aren't completely compatible, right?
| A C++ compiler is not substitute for an ANSI C compiler.

There is a significant subset of ANSI C which is also valid C++. So again you are both right, and both drawing dubious conclusions from your bit of rightness (is that a word? Correctitude?).

| > Lately though, I've become interested in working with embedded PC's, and
| > regular old C strikes me as the best approach for coming up with most
| > applications for those cute little things.
|
| Guess what Charles, it won't run Windows well.

Where did you see anything about Windows? Are you reading one post and
commenting on another? And what has this embedded stuff got to do with
networking anymore?

Followups directed to alt.flame.

Sounds great. Another decade or two, and maybe they'll catch up with what
the professionals have been doing. - Naw, probably not. Linux software is
generally pretty crappy stuff, a poor substitute for the real thing, unless
you are a "junior Internet professional".

>

From what I hear, even the lousy Linux version can handle regular old C.
Maybe thats wrong. Wouldn't surprise me. It's famous as a piece of crap,
among C++ programmers. Maybe that's part of the reason why.

The good compilers handle it just fine.

Guess what? The great majority of embedded PC applications don't require or
use Windows, so that's hardly a significant factor.

You DO know what an embedded PC is, right?

Charles, N5PVL

Since Linux is a "flavor" of UNIX, do you think that way about all the UNIX
software that has been written over the past 29 years?

> > > You can write standard Antsy C code with any of the C++ compilers, of

Duh. By definition, of course they do. If they couldn't, then why would they
be described as good?

Maybe in theory, but in practice I have not seen programs that
played MOD or MIDI files on my new "plain" D/A soundcard as well

as they did on my old GUS. At least not under Linux.

Of course this is not that important anymore, as these days one
plays MP3 files, not MOD or MIDI.

The problem with all software solutions is that someone has to
write the software...

All well and good, but since this is rec.radio.amateur.digital.misc,
how would you apply wavetable synthesis to, say, PSK31?

Or MFSK? Or any other digital communications mode?

The wavetable synthesizer can do any multi-tone FSK and probably PSK as well. Of course only the generation, not the decoding. The average 16-channel wavetable synthesizer would not have trouble synthesizing a 16 channel FSK signal at up to 100 baud without any CPU attention. 32-channel and more also exist.

Hi there fellow warblers... MixW version 2.0 RC8 has now been uploaded to
our website which is:
http://www.nvbb.net/~jaffejim/mixwpage.htm the following changes and updates
have been made:
- Expiration date (for unregistered users) is July 14, 2001.
Added:
- RC8 changes:
- New soundcard module with much better RX stability in heavy multitasking
  environment.
- Manual RX is supported for SSB and CW with usual highlighting, call
  grabbing etc. (For CW: goto Mode settings/Rx Algorithm/Manual)
- Multiple call registration is available
- Mode specific info is displayed in the status bar.
- some minor bugs were fixed
- expiration date for non-registered users is set to July 14.
- Several contest bugs are fixed, but contest mode is to be re-written.

For those of you who are not familiar with MixW 2.0.. MixW 2.0 is the
Shareware version of our very popular FREEWARE DigiPan and employs the same
easy pulldown menus and easy to read illustrated Help files and easy setup.
Unlike DigiPan Mixw is able to do ALL digital modes such as RTTY, CW, PACKET
VHF /HF, Pactor RX, Amtor RX, Pactor FEC TX/RX, Amtor FEC TX/RX. PSK, QPSK,
FSK31 MT63, MFSK, Throb, Hellschreiber, SSTV, Voice keying (call CQ or
anyother message in your own voice) Contest logging, regular logging, CAT
and Rotator control. plus much more.. Happy Warbling and 73 ... Jim, WA2VOS

Is anyone (else) thinking of attending DefCon 9?

Would like room sharing arrangement with relatively
"normal" amateur or experimenter.

I run WinAPRS and have been leaving my station running unattended, including leaving the computer running.. Do I need to leave the computer turned on and running WinAPRS for the TNC to continue to operate in APRS mode? Or, can I turn off the computer, or exit WinAPRS and go to another application while the TNC continues to act like APRS is running?

I recently pulled my old PK232 out of its box and connected it. I was running WinAPRS on it and things were working just fine. Then, I tried to run it on AEA's Pakratt for Windows and could not receive stations on packet.

Then, when I went back to WinAPRS, the PK232 causes my transceiver to transmit just fine but it will not display received stations. The transceiver is receiving stations and the DCD light on the PK232 comes on but nothing displays.

When I disconnect the PK232 and go to my KPC-12, WinAPRS works just fine.

It may be that the PK232 is stuck in the HOST mode. I accessed it through a packet terminal program and issued the command HOST OFF. And, on WinAPRS, I select AEA-EXIT HOST MODE.

Anyone have any ideas? How do I get this thing out of host mode? I have tried removing the battery jumper for a couple of minutes -- maybe I should pull it overnight???

Thanks for any assistance.

To take the PK232 out of HOST mode type ^AOHON^W (that's Control A &
Control W). Works on mine!

I am trying to install the AX25 support on my Red Hat v7 system and I can not find any recent information. The HOWTO-AX25 is dated 1997, refers to kernel 2.1 as the latest, and gives web URLs that no longer exist.

Does anybody know where there is more recent info about how to install the AX25 kernel support, get the associated utilities, etc?

Roger:

Thanks for the tip but that does not seem to help.

I have -- as best I can figure -- turned off the host mode and still the PK232 does not display received stations. I am receiving APRS stations. When my transceiver receives a signal, a green LED lights and the signal strength indicator goes full scale -- at the same time, the DCD light on the PK232 comes on and the signal strength bar on the PK232 lights up but no station plot appears.

If I disconnect the PK232 and replace it with my PK12, WinAPRS works just
fine.

I cannot determine why the PK232 does not want to display the position and
plot of received APRS signals while the PK12 does so with no problem.

  Just wondering if anyone is using a Mac for the digital modes.
Seeing as though most devices use serial cable connectors will the
serial to USB adapters allow me to use my say KPC3 + and the
Rigblaster on a Mac if I decide to switch platforms? Any insight
appreciated.

Macnet is the WW group of Ham Radio Operators that use Mac computers to extend their communications capabilities.

We stay in touch with each other via Radio, Internet, Telephone, and actual visits.

o Amateur Radio CALL SIGN
o FULL NAME
o Street ADDRESS
o CITY, STATE, ZIP
o EMAIL ADDRESS

To join Macnet, send YOUR STATS to mailto:wd1v@mediaone.net and access

* Macnet Member Listing - as the name implies, its "The List" of all of the hams in the world that are using Macs with their radios. In ZIP CODE order so you can see your neighbors and get together easily.
ftp://ftp.qsl.net/pub/wd1v/Macnet2001.html

* Macnet Ham Radio Software Listing - "The List" of the latest - much of it with FTP links so what you see is what you can get with just a click.
http://www.qsl.net/wd1v/Page7.html

* Macnet Software Collections
ftp://ftp.qsl.net/pub/wd1v/
http://www.qrz.com/download/mac/index.html

* For latest Mac versions of the already cool...
http://www.versiontracker.com/

Joe,

all of your symptoms/indications so far seem to say your radio to PK232 interface is working okay (good signal strength, apparent good decode of the packets).

How about checking the communications between the PK232 and your computer? Maybe there is a mismatch. Recommend trying to "talk" to the PK232 using your computer's terminal mode, such as hyperterm or equivalent. If you are unsure of how to do this, people on the newsgroup should be more than happy to lend assistance.

Here's a hint: Start the terminal program, set it to the correct COM port, baud rate for the PK232, number of bits etc. The PK232 used to default to 1200 or 2400 EvenParity 7bits 1stop (2400E71) but may be set to some other baud rate such as 4800N81.

If you see the PK232 "start up message" when you subsequently turn the TNC on, you're in business to talk to the PK232 and set it to the settings that the WinAPRS program is expecting. If you see garbled text, there is a synchronization problem between the computer and the PK232. You can usually re-synchronize the PK232 to the computer by typing ASTERISKS (shift-8) at approximately one second intervals.

Hope this helps.

One other way I've seen to break the PK232 out of the host mode is to type a series of CTRL-C's (about three per second).

If you exit out of WinAPRS and leave the TNC unattended, the TNC memory buffer will fill up with received APRS packet info and not transfer it to the computer. Eventually, you may get a memory buffer full, or equivalent, message. The next time you start WinAPRS, the TNC, I think, will dump all of its stored packet into into the program.

Yes, it's the familiar old story.

Isn't that the old obsolete stuff that still uses the KISS protocol? Unless you are into nostalgia, I can't really see why you would bother with that stuff. It's the latest in Amateur Packet Radio networking from the 1980's.

You could go through all the trouble to hunt down the flakey, poorly documented Linux AX25 stuff that's been obsolete for years, and I guess it WOULD get you on the air, about like a bicycle WOULD eventually get you to work in the morning.

Each to his own, I suppose. Personally, I often wonder why the "open code software" developers that we hear so much about haven't come up with anything for Linux that is any more sophisticated than what Hams generally used to use in the 80's.

Professional programmers sure have! - But they hardly ever bother with Linux, and who could blame them? The compilers for Linux are a joke, their one claim to fame being the fact that they are "free". Guess you get what you pay for, and professional programmers are glad to pay for professional software that allows them a decent shot at productivity.

Knowlegable Hams have learned that "open code software" generally means "buggy, obsolete, poorly written and documented" software. - Like the AX25 stuff for Linux, for example. And , of course, Linux itself.

Unfortunately for Linux users, the only way they can "play" with modern Packet Radio is to set up a serial or ethernet link to a DOS box that handles the radios.

It would be better of course if there was simply something not no outdated that ran under Linux itself, but the "open code software" system has not produced anything worthwhile. - Just a difficult to implement hack that, if set up perfectly, will reward your efforts with third-rate performance from yesteryear.

When "open code software" bots are faced with this question about why "open code" has not delivered anything worthwhile, the standard response is a whine because the real, professional programmers will not hand over their code to them.

Haw Haw Hawr!

Judging by this response, I'd opine that "open code software" bots are a bunch of no-talent cut 'n pasters who couldn't write any significant, original code if their lives depended upon it.

That would go far in explaining the embarassing obsolescence and retarded documentation common in the "open code" software that you get stuck with, when you try to use Linux for Ham Radio. - Or anything else.

Seems to me that a lot of folks are paying a big price for being cheap. I feel sorry for Hams who have listened to the Linux hype thats been going around for years, and eventually end up wasting their money and taking up valuable hard-drive space for crappy , poorly implemented software.

Why don't the Linux folks either come up with something decent, of admit
that they are promoting the use of crap?

GCC a joke?

I'm not an Open Source Zealot, in fact, I have many criticisms
of the Open Source religion, but GCC is one of the unmitigated
success stories in Open Source history.

Next thing you'll tell us that Apache is a joke, too.

You might take a moment or two to look at the IBM
Linux page: http://www-1.ibm.com/linux/

AIX is a much better OS than Linux, but I see where IBM
is value-adding the Linux into the OS, so the software can
be compiled and go, rather than the hours spent porting this
or that code. I have installed the new AIX 5.0 on one machine
and it is AIX 4.3 with the Linux goodies. I just got the fresh
AIX 5.1 so expect to find another well done product.

The only thing I program in C anymore is the Linux box, that's because all the cheap C compilers have gotten fat and pricey for the DOS and Win-DOS machines. Borland used to be cheap and good, but they are for professionals unless you get a stripped-down version. Don't get me wrong, I love my Microsoft OS stuff (Office, Street Atlas, Media Player, etc), but I could never complete anything that didn't use Visual Basic as the GUI base, and the C would have to integrate with that.

If you want to see what Linux is good for (would be a nice thing to hook a radio to :-) take a look at:

http://www.galleo.com/

It's a handheld Linux machine from Palestine.

Remember, Bill Gates said the Web browser IS the new Windows. Only Janet Reno didn't understand that.

Looking for a manual for a Tiny-2 by Paccom that I acquired at a
hamfest. Naturally, no manual was available at the time of purchase.

An alternative would be someone that is familiar with this unit that
could sort of guide me thru getting it set up. I seem to be getting
power, but no communications the the computer from the TNC. Have a
feeling it may be related to a flashing light on the front panel of the
TNC labeled "STA".

Once I get things communicating, I think I can move forward from there,
but am a Baycom user, so this is kind of new to me!

Thanks

Brad

How about Visual C++ ?   - Or Borland's C++ Builder?

The C++ compiler in Linux is a real joke. - That's part of why Linux bots do not traditionally go for C++. There are other reasons, of course.

Borland has a released a non-gui (command line) version of C++ Builder as a freebee, and third-party developers have come up with a few gui interfaces for that. - But unfortunately those homebrew gui's just don't stack up against what you would find in Visual Basic or Visual C++.

I'll bet the full-boat, gui version of C++ Builder is a lot better, but dunno for sure as I haven't seen it yet. It's gui interface would have to be pretty lousy NOT to be better than the homebrew stuff, and with me at least, Borland has a great reputation. My first Borland "Turbo Pascal" compiler ran in a KayPro II CP/M machine, many moons ago, and (so far) I have never regretted tossing money down on the counter and going home with their software.

You can write standard Antsy C code with any of the C++ compilers, of course, - but when you need all that gui stuff, it's in there there waiting for you.

Yes, I like VB too. My copy is old, the 4.0 Professional version, but I still have a heck of a lot of fun with it. I've thought about upgrading to version 6.0, but so far I have managed to get by without "tool tips", the Application Whizzard, and the other bells 'n whistles to be had in that version.

Lately though, I've become interested in working with embedded PC's, and regular old C strikes me as the best approach for coming up with most applications for those cute little things.

>feeling it may be related to a flashing light on the front panel of the
>TNC labeled "STA".

If STA is flashing at a regular speed, it means there's mail in the TNC's PMS.

As a starting point, use a simple terminal program to try and connect to the TNC, and make sure the program is using the same baud rate as the TNC. The terminal baud rate of a Tiny-2 is set my moving a jumper on a header behind the front panel, so if you remove the front panel you can check the setting. There are two headers - one for the terminal baud rate and one for the RF baud rate - and they are labelled.

There is a list of the Tiny-2 commands on Paccomm's web site -
http://www.paccomm.com/cmdrefcrd.html

Whether the TNC supports all the commands in the list depends on the firmware version.

Claiming that standard Antsy C is useful for writing modern software.

Sorry, but most folks expect a gui interface these days, and they want it to work in the Windows platform.. Wake up and smell the coffee.

Ah, so you're talking about GUI and IDE support, not compilers?
You know, there is a way to produce a GUI interface that works on
Windows and any other OS (including the increasingly popular
non-Windows embedded devices) - speaking of coffee.

I suppose if we were talking about Windows application programming,
you'd have a point. The original question was "how do I get the
Linux AX.25 stuff running", which has nothing to do with Windows or
GUI, and you answered with a sweeping condemnation of Linux and GCC.
Now you're attempting to change the discussion to something else
entirely.

Dana H. Myers wrote:

> You know, there is a way to produce a GUI interface that works on

Perhaps I should clarify here; there are at least two ways to produce GUIs that are independent of the underlaying platform in common use today.

One of them is almost too obvious - develop GUIs using mark-up language. This is already commonly used in many, many products and projects; an application includes a simple HTTP server and presents an interface using HTML. It is not difficult and buys many advantages in one fell swoop; any kind of device that can render HTML can present the GUI and the architecture inherently scales with a network. The potential disadvantage is that the intermediate network has a profound influence on the performance of the GUI.

Another method of producing a platform-independent GUI is to develop a GUI using a platform-independent run-time; while Microsoft is making noise about C# and .Net, Java is already in wide deployment, even on smaller (wireless) devices. For those not familiar with Java 2 Micro Edition (J2ME), it is the basis of the wildly successful NTT DoCoMo 'i-appli' service, it is included in the Motorola i85s and i50s iDEN handsets, and Nokia announced broad support for J2ME a few weeks ago - not to mention Siemens and a healthy list of other handset makers.

At JavaOne this year, I was delighted to see a demo of a fully MIDP-compliant video player from HelloNetwork running on an i85s, rendering a real-time video stream via the Nextel network, and then the HelloNetwork guys installed the exact same binary on the newly-announced Nokia J2ME handset - where the video player worked flawlessly.

What started this discussion was a question about running Linux AX.25 kernel-level code, and an answer was "the compilers on Linux are a joke", followed by a snide comment about "Antsy C". Of course professionals build kernel-level code with C and C++, and GCC has evolved into a high-quality tool over a period of 15 years. Criticising GCC for something it isn't - a turnkey GUI development tool - made no sense.

Further, the world of client implementations is rather quickly evolving to primarily embrace non-Windows architectures. There are alternatives to building Windows apps that are forever tied to Windows platforms, and it isn't just religion that makes this appealing.

The compilers for Linux are a joke, their one claim to fame being the fact that they are "free". Guess you get what you pay for, and professional programmers are glad to pay for professional software that allows them a decent shot at productivity.

Clearly incorrect. I know of many professionals that use Linux. Because of its "open source" and ease of portability from other Unices, it's a better platform that those buggy Microsoft OS's.

> Knowlegable Hams have learned that "open code software" generally means "buggy, obsolete, poorly written and documented" software. - Like the AX25

> stuff for Linux, for example. And , of course, Linux itself.

Knowledgable hams also know well enough not to listen to you. Many of the programs for Linux are quite well documented.

Simply not true. Many applications that used to be "Windows only" have been ported over to both Linux and the Apple lineage of machines.

Hi,

There is a small APRS transmitter sitting on my desk that amazes me. Inside, there is only a PIC16F84 running at 10Mhz, resistors and transistors. It DOES NOT HAVE a MX164, TM3105 or any other modem IC. The PIC is code-protected and I can not read it. I wonder how the PSK signals is generated only with the hardware inside the pic. It works great and is REALLY SIMPLE.

�Does anyone know can that be possible?
�Anyone has the firmware for the pic?

It would be small and cheap for anyone if we could get the PIC program...

Thanks everyone.

I know how it is possible, it's fairly trivial to build
a direct-synthesis audio modulator for FSK (APRS uses Bell 202
1200 baud FSK) and send a data stream. I've done it on an
8051 years ago, and later on, did it in C on a PC. Really
not that hard to do but certainly outside the scope of a
Usenet posting.

No, I don't have PIC code to do it, but, once you understand DDS, it's easy to do. You have a sine lookup table of particular size, and generate a stream of audio samples by looking up every N-th entry of the sine table. The value of N, the increment, is what controls the frequency of the resulting data stream.

To send a packet signal, you need to create the data packets, then convert them to HDLC, and use the resulting bit-stream to control the increment used in the sine lookup table.

It sounds complicated, but it's not that difficult, you just have to understand one part at a time. I'd suggest looking for "Music Applications of Microprocessors", a terric volume on audio generation and filtering, really a DSP text in disguise without the brain-twisting math.

For AX.25, you'll need the downloadable AX.25 2.1 Specification from http://www.arrl.org/ or maybe http://www.tapr.org

For APRS, you'll need the APRS spec from TAPR.

For the X.25 bit encoding, the AX.25 spec may be enough, otherwise, a datasheet for an SCC chip is pretty good (Z8530 or somesuch).

Indeed. The problem "how do I send out my position out a parallel port
that has only a couple of resistors wired to it and be compatible with
other sending APRS via a TNC" sounds almost impossible to solve.
But the problem can be split into many "layers" that all are simple, but
each has some nasty details you should get exactly right.

APRS
AX.25 UI frame
HDLC frame with CRC
Flags and bit-stuffing
NRZI encoding
Sine wave synthesis

This will make it a bit difficult to implement and test. But it has been
done in other environments as well (e.g. packet via a soundcard) so it is
possible to look at other people's solutions.

Hello,

I am trying to connect to an APRS Server via internet but it does not work.
It displays "TCP OPEN FAILED" in red colour on the bottom of the screen.
It happens with any server. I have already put the TGP Extension in the
extensions folder.

I am using iBook System 9 and G3 Blue System 9.1.

Any idea about it ? I would like to see if it really works before
registering the program.

Waiting for help, better by direct email:

Have a look at the PMP (Poor Man's Packet) program for MS-DOS. It implemented all the higher levels and generated a binary output signal for the parallel port to drive an external FSK modem, so the only thing "missing" is the sine wave synthesis.

It should be noted that in Bell 202 used for 1200 bit/s packet, the mark frequency is 1200 Hz, thus, a single bit will be represented by a single complete audio cycle. The space frequency is 2200 Hz, thus one space bit generates nearly (but not exactly) two audio cycles at 2200 Hz. This means that the audio waveform zero crossings do not generally occur when the data bit is changing, thus, it is essential, that the phase continuity is maintained during bit switching.

This can be done with the NCO (Numerically Controlled Oscillator) principle used in DDS. In this a sample clock is running at least twice the highest audio frequency and at each sample, a constant is added to the phase accumulator. Using a larger constant will advance the phase accumulator faster, thus generating a higher frequency. Just generate sin(x) from the contents of the phase accumulator e.g. using a small lookup table and run the result through a DAC (e.g. a few resistors connected to some output ports) and run the audio signal through a reconstruction (RC low pass) filter to get a more or less sinusoidal wave.

The question is a bit complicated what sampling clock frequency should be used for the NCO. On one hand, it must be at least twice the highest frequency (2200 Hz), so in principle 4400 Hz would be sufficient, however, to simplify reconstruction filter requirement, it should be higher. In this case, it would be nice to be able to generate the 1200 Hz bit clock from the NCO sample clock. Thus, 4800 or 9600 Hz might be good choices.

If the sample clock is running at say, 9600 Hz, it is a good idea to output the new output value (calculated but activated during the previous interrupt) to the DAC at the beginning of the timer interrupt. At every 8th interrupt the higher protocol levels are processed 1200 times each second. Thus, the DAC output is updated at regular intervals regardless how long the rest of the interrupt service routine executes.

A 6.6 kHz NCO clock rate might also be useful (5x2.2 or 5.5x1.2 kHz), but in this case, only every 11th interrupt will handle the higher levels 600 times each second, so two bits should be generated during this execution.

When simulating what sample values a particular DDS will generate, the output may look quite horrifying, but remember, it is followed by a reconstruction filter (a low pass filter), thus reconstructing "missing" sine wave peaks etc.

While it may be easier to use that layered approach as Rob suggested, in which is easy to split between the higher and lower levels by putting the higher layers into normal programs and only putting the one or two lowest levels into an interrupt service routine, it is, however, quite feasible to do all those things in an interrupt service routine. This saves RAM space, since buffers do not have to be allocated for the intermediate layers. Thus, the only things the highest level has to do is to get the positional information from external sources (such as GPS) and convert them into the obscure units used by APRS :-).

In order to avoid overloading the 8th or 11th interrupt, multiple sample clock interrupts during a single bit time can be used to do parts of the high level work.

I have no idea, if this particular processor supports interrupts, but similar results can be obtained even if the routine is activated after a free running hardware counter has reached predefined values.

Message-ID: <20010704130639.11519.00004534@ng-fc1.aol.com>
Xref: archiver1.google.com rec.radio.amateur.digital.misc:3045

I just reloaded all my software on my computer - including Windows ME
```

Now, all of my PSK programs will only receive from the SOUNDCARD MICROPHONE IN

If I connect the audio out from the XCVR to the LINE INPUT - the PSK program receives nothing - I know the audio is going into the card because I can here what I am receiving through the speakers connected to AUDIO OUT.

I prefer to use LINE-IN - its much less sensitive than MICROPHONE IN - in addition some of the DSP audio programs worked well with LINE - IN -- but now - LINE in doesnt work with any programs.

Any ideas what I can do to use LINE IN like I used to???

Ive tried setting all the levels on the audio control panel but nothing there gets the audio to the program when using LINE IN.

Thanks

In the sound card mixer control panel there should be check boxes to let you select mike in or line in and there should be a level control for each.

Double-click the Windows volume control in the systray. Select Options, Properties, Recording. Make sure Line is selected, and that the volume is at a reasonable level.

Until the wave in soundcard-based digital modes, hardly anything in the dreary, moribund world of ham radio was worth the attention of Linux developers. Nevertheless, here is one collection of Linux ham software: http://radio.linux.org.au/.

By the way, WTF is "open code software?"

Apparently, he's unaware that it's also "open source" software - since I guess
that he's only seen precompiled (but free) versions of it.

Speaking as a professional programmer who has done cross-platform
development on many different flavors of Unix ... GCC is not near
as good as using compilers specific to the target architecture.
e.g. the Intel reference compiler for X86, Sun's compilers for SPARC, etc.

> I'm not an Open Source Zealot, in fact, I have many criticisms
> of the Open Source religion, but GCC is one of the unmitigated
> success stories in Open Source history.

The fact that it is a "fairly good" compiler with "quite good" retargetting
is the big plus ... unless you need to squeeze that last cycle out of
your instruction stream.

> Next thing you'll tell us that Apache is a joke, too.

Excellent server ... if you have or are willing to hire the support staff.

> You might take a moment or two to look at the IBM
> Linux page: http://www-1.ibm.com/linux/

In my opinion this is the best thing to happen to the open source
movement in many years.

Sure wish someone would fix the Linux AX.25 and NET/ROM code though.
It is a mess, and in particular the NET/ROM code has serious protocol errors,
as does the BBS code that uses it. Good "first try", but needs a lot of work.

Maybe I'll take on that project once I'm done with the current project.

Who said "Windows"? Nobody did.
He said it was impossible to do with a soundcard and without a TNC, which
obviously is nonsense. There may be licensing issues for some of the
mentioned protocols, but certainly not for all. And there may be technical
issues with Windows, but you can run another OS.

>Many sound card programs implement packet. But packet is NOT a synchronous
>mode and does NOT require strict timing.

There was a generic "any mode that has error cqn builtin.", including
packet. This is obviously bullshit. Packet programs are widely available,
and demonstrations of soundcard modems with advanced error correction can
be found as well (e.g. on KA9Q's page).

What may be lacking is a turnkey solution that implements a de-facto
standard protocol. But that is not because it cannot be done, as was
the claim.

MFJ and CSS release MultiComm Host/ Multimode for Windows 95, Windows 98, Windows Me, Windows NT and Windows 2000

Muscle Shoals, Alabama. June 5, 2001: MFJ and Creative Services Software announced today that MultiComm Host for Multimode 1.5P, a 32-bit host mode program for the MFJ-1278 TNCs has been released. The program takes advantage of the advanced features of Windows 95, Windows 98, Windows Me, Windows NT, and Windows 2000. MultiComm Host/Multimode uses the TNC's 'BLP' host mode for Packet communications and terminal mode for the HF and SSTV mode. Its MFJ part number is MFJ-1289H.

Company President Rick Ruhl, W4PC, said, "BLP Host Mode was created by Howard Goldstein, N2WX, in 1991. According to the MFJ technical staff, we are the first company in the 10 years it has existed to successfully interface to BLP Host Mode. This 32-bit version also supports PSK-31 by using the sound card for the PSK-31 audio and the TNC for the keying circuit. While this version is considered a Preview version, all functionality except for robot CQ and SSTV transmit is implemented and has been tested thoroughly in house, by the MFJ staff and our fine beta team in the field"

Product features include: Each stream has its own window and transmit buffer, support for the major callbooks on CD, user configurable colors and fonts, a 'bottomless' receive window, automated connections, binary file transfer, runs true 32 bit multitasking and multithreading and is easy to use with online help at your fingertips. All of the MFJ-1278's HF modes are supported including SSTV and PSK-31. It includes CSS's 'Auto logging' technology which allows you to log contacts directly from the program to CSS 's own Log Windows or DXBase 2002. A demo can be downloaded at http://www.cssincorp.com/multicommhost and retails for $79.95.

"The program is written in robust C++ ", Ruhl said. "Which allowed us to add features to the program that couldn't be done in other languages."

Creative Services Software, Inc was incorporated in 1988 and created the 32 bit Terminal program for Kantronics TNC's, PacTerm '98 and PK-Term '99 for AEA/TimeWave. CSS also develops, sells and support the top logging software product, Log Windows. The web address for CSS is http://www.cssincorp.com, for MFJ http://www.mfjenterprises.com

K6STI's Ritty program did Pactor before he became annoyed and stopped distributing it. I do not know if his new Ritty does pactor. The old one was a DOS-based soundcard program.

Radiofax friends,

A new version of our "Worldwide Radiofacsimile Broadcast Schedules" dated June 05, 2001 may now be found on the web at:
http://www.nws.noaa.gov/om/marine/radiofax.htm

Please also visit the U.S. National Weather Service "Marine Product Dissemination Information" Webpage which contains information on the dissemination of marine weather forecasts including radiofax, such as frequency and broadcast schedule information as well as links to products and related information . See:
http://www.nws.noaa.gov/om/marine/home.htm

The accuracy of this publication depends on YOUR input.
Please direct comments, recommendations, additions or deletions for this

publication to:

Can anyone help me with dates for some of the major events in the
development of the technology of packet radio? Any significant
developments not mentioned here are omitted because I'm only looking at
the technology used on the UK network. The dates in brackets are my best
guesses.

AX25 V1 (1982)
AX25 V2 spec (1984)
TNC1 design (1982)
TNC2 design (1985)
Netrom (1985)
First BBS software compatible with modern forwarding protocols (?)
First use of compressed forwarding
KISS spec (1986)
G3RUH modem / any earlier 9k6 modem design (1987)

Yes, RITTY version 2.xx did Pactor under DOS. It worked quite well. The
newer versions of RITTY only do RTTY. But I understand that Brian K6STI
still sells licences to the old version 2.38 for RTTY and Pactor.

Tom Sailr, HB9JNX devloped a FREE sound card program for Pactor but it
requires a sound card with a PersonalSoundArchitecture (PSA) Chipset from
Analog Devices, such as Echospeech Personal Sound. I don't think you can
buy these sound cards anymore. It also ran under DOS. See Tom's
homepage -- http://www.baycom.org/~tom/ham/ham.html

I also believe that there is a FREE sound card program for Pactor running
under Linux.

The big problem is trying to implement the BURST modes under Windows. It
may be possible to implement a NEW Burst mode under Windows with more
RELAXED timing requirements. Maybe we will see that one day!

The old HamComm DOS program did AMTOR ARQ with just a bit-banger
serial port interface.  Is the timer resolution better under DOS?

Take care,

Dave

Interesting side note: one of the original TNC2 Alpha cards (with a bunch of blue wires on circuit board) is still on air here in Oregon.

Wonder if any 820 stuff is still on air?
There was the FadPAD, a "dual port digipeater", and BBS code for it.
Probably more as well (?)

Last BBS I know of using that machine shut down about 4 years ago.
It was in New Zealand, but I have forgotten the callsign.

PA0GRI had one running, I am sure he still has it (he never throws
something away it seems) but it has not been on air for a decade...

The simple answer to your question is YES.

It is also a lot easier to implement BURST modes under DOS since you don't have too many other programs running at the same time. (You might have a TSR running under DOS. But if it is a problem you remove it). A typical Windows session is running at least a half a dozen programs at the same time just look at your task bar! The other programs often cause problems with timing. e.g. If your have set up your system to check for EMAIL at regular times, the mail program will often mess up your sound card program running RTTY or PSK31! Windows was not really designed to be a real time multi tasking OS.

We've created a new online ACARS club for all those interested in the
subject. By joining the group, you can...

* Chat to others with the same interestes (via the Message Board or real
time chat)
* Post ACARS/Aviation related events on the group Calendar
* Post your favourite pictures
* Add links to your own web sites

This is not intended to try and replace the excellent ACARS Mailing List.
It's been created to give people a more "interactive" on-line experience.

The group is located at http://uk.clubs.yahoo.com/clubs/acarsonline

Cheers,

Mark

And don't forget the famous TNC64 terminal program for the Commodore 64 produced and sold by the Texas Packet Radio Society back in the mid-80's to fund the first elements of TexNet.

Don't feel bad if you don't recall it or never heard of it. The only reason I remember is that I wrote it!   <:}

Well...

I think the history of packet excludes everything not AX.25, else
we will start bringing in ASR-33, etc into the history :-)

Thread:

I don't know the exact dates and names, but by my recollection amateur packet radio originated in Canada...

The first "authorization" for amateur radio packet radio operation was by Canada's Department of Communications, DOC.

The Director General of Radio Regulations at that time was Dr. John DeMercado, who had been a student of Leonard Kleinrock's at UCLA. Dr. John was forward looking with respect to digital radio techniques. Although not a ham at the time he promulgated the new digital radio regulations, I believe that he eventually became a ham himself.

I believe that the first legal packet radio operations by radio amateurs occured in Canada back in the late 1970's and that this preceeded authorization by the FCC and operation by US Amateurs by at least a year or perhaps two or three.

As I recall there were two groups who got this started in Canada, one was in Vancouver, British Columbia, the Vancouver Digital Radio Group??? or something like that... The other was a Montreal, Quebec group.

One or the other of these Canadian groups produced and distributed TNC's and code for a protocol that was similar to and which precdeeded AX.25. I believe that they also played a role in the development of AX.25.

Best contact some Canadian hams, or perhaps the RAC "Radio Amateurs of Canada" for the exact history.

Thanks, Peter! I have heard of the pioneering work done on packet by the Canadians, but never heard much detail until your posting here. Those folks most definately deserve recognition for their accomplishments.

Etc...

One or two people have asked me why I asked this question? So -

As some packet users in the UK may be aware, I think that some of the problems of our network result from the mailbox licensing system (NoV) that was introduced in 1987/88 (still not sure which, the RSGB who administer the wretched system, don't seem to know). It is a system that has discouraged development, and has given a much higher priority to regulation than to experimentation.

Virtually no development in the technology of the RF network occurred from around 1985 to 2000, most of the network is still 1200 baud, and we're now increasingly relying on internet forwarding.

I'm not saying the licensing system has caused all the problems, but it certainly hasn't helped. So when one of the long-time supporters of the system said in a packet bulletin that more development in technology had taken place since the system was introduced than before, I just had to gather a few facts...

Ah, I hoped you would be building a website with some packet history, that would clearly show the concentration of all development between 1985 and 1990, and the very clear decline in the past decade...

Anyhow, we have a similar licensing system over here, but after a couple of messups by the licensing authorities, there has been no monitoring (or at least no reaction) of content, only of use of frequencies different from those in the BT (similar to your NoV).

So, any HAM can operate a station within the amateur bands at any frequency he likes, but a station with BT (which formally is required to permit unattended operation) is only allowed to operate on its planned frequency.

This has lead to unfortunate situations (in the days when activity was high) where stations with a BT were stuck to their unusable (overcrowded) frequency and were officially warned when they moved, but other amateurs who just put something on air and operated it under their own callsign could use whatever frequency they liked. Even those frequencies that BT-approved stations could not leave.

It probably was done to avoid packet radio to take up every free space in the amateur radio bands, but in retrospect it is easy to see how dumb that decision was. Lots of effort and emotions were wasted on discussing frequency allocation plans, and many have left the scene, frustrated about the radio societies bandplanner trying to decide if a certain frequency would be suitable for operation of a BBS or Node in a part of the country he has never visited, certainly not on a rainy sunday afternoon.

Rob

VADCG (Vancouver Amateur Digital Communications Group ?) did a controller that got quite a bit of use outside Canada. The other work was done in Montreal.

All my old newsletters from that time period are packed away somewhere.

I looked through the links and have found NO definition of ACARS? I gather it is a Aviation APRS system? Somebody must have a simple overall explanation? Is it commercial? Can general aviation use it? How?

BTW, did anyone see APRS Aviation Mobile as N2RHV-7 on N8302A flying from Orlando FL, to Hilton Head, SC on June 7 and back on June 8? I received over 101 stations on my PocketAPRS w/ TH-D7a & Garman II system all over FL and East Coast - even got a station via TCPIP from LA!

A little altitude always helps.

Anyone using Icom IC-718 and PSK31?
Of particular interest is the use of narrow filter FL52
in ssb mode?

Thread:

Back in that era... mid to late 1970's Canada was a pioneer in commercial X.25 packet networking.

Although X.25 was "developed" by the ITU's CCITT led by European PTT's back then and was one of the ITU's X. series of Recommendations, most commercial data communications of that era was conducted over private lines using private line modems and IBM BiSync communications protocols. The X.25 ITU Standardization "push" came from European commercial network operators who wanted to break IBM's hold on commercial data networking.

In this situation the Canadians, both manufacturers, like Northern Telecom and operators like BellCanada which also owned Northern Telecom then, were sort of half way between the USA and Europe. The Canadians [Northern and Bell] thought they saw an opportunity to exploit the X.25 protocols over on this contintent.

Canadians set up some of the earliest, if not the first, commercial common carrier X.25 packet networks. Bell Canada, IP Sharpe and Associates, now Reuters, CNCP Telecommunications, etc... all had commercial X.25 networks in operation before there were any X.25 commercial networks in the USA, e.g. TimeNet, TeleNet, etc...

In that era, Northern Telecom had a big [for that era] commercially successful X.25 packet switch called the SL10, which they successfully sold around the world to many common carrier packet network carriers, for instance Bell Canada, Deutche BundesPost, SAPO, etc... Today they call those things [packet switches] "Routers" and the packet protocol "de jour" is IP not X.25, the Internet is "the network" and Cisco is the king of that business.

So much for being first, eh?

All of this commercial X.25 activity in Canada, coupled with the Canadian Department of Communications interest in promoting Canadian efforts in packet switching, was probably the spur that got the Canadian radio amateurs started early on amateur radio packet switching.

I'll bet some hams from either the Vancouver or Montreal groups were professionally involved with some of the commercial X.25 developments in Canada in that era.

I am starting to try psk31 for the first time, and have installed gpsk
on my suse 6.1 system. The program starts OK, and says:

```
root@suse1 [288]: gpsk31 &
root@suse1 [289]: Using full duplex mode!
*
```

And the window appears. I have audio from my radio going into the
line-in connector of the SB card. My speakers are in "speaker out" and I
can hear the signals on the band, so I know audio is going into the
card. All the card volume settings are at about 80% up. But, as I tune
the band slowly (14.070 to 14.100), the program never seems to locate a
signal. No waterfall display ever starts, and the dot stays red in the
phase indicator. I must be doing something wrong, but I don't know what
to do. Any ideas? Thanks. -Pat KE2LJ

It is allowed to send email using the internet in the UK.

I get email frequently from folks in the UK, with no problem.

Here we are allowed to send email using ANY mailhost on
the internet, with no restriction at all.

But what does this have to do with Ham Radio ???

Did you check your mixer settings? It's possible you either have line-in
disabled, or the volume slider is down too far.
Jim

This is an amateur radio newsgroup, Einstein. (Duh!)

Never seen a landline lid yet who could give my pet weenie-dog any competition in the brains department. A real pack of idiots.

Yes, "Mr. Conklin", this includes you. If you are too inbred and ignorant to stay on topic, (and apparently you are) then take a hike. This is a Ham Radio newsgroup.

Charles Brabham, N5PVL

I think he was referring to TCP/IP over packet radio which dose require a amateur license (at least if is a ham band). My 2 Cents de WO5M

Of course the telecom companies and regularatory bodies still have not
recognized this situation, and keep developing their own standards for a
wide area network (preferably still circuit-oriented), which the de-facto
world-encompassing network uses to transport its datagrams...

>I'll bet some hams from either the Vancouver or Montreal groups were
>professionally involved with some of the commercial X.25 developments in
>Canada in that era.

Yeah that is probably right.
I still have mixed feelings about the decisions they made. HDLC is
a nice framing protocol, but the fact that no existing equipment in
amateur radio shacks is able to generate it should have been a warning...
Later, the situation only became worse. Everyone had computers in the
shack that were perfectly capable of ASYNC communications supported by

hardware UARTs, but for HDLC they needed to use

- an external TNC, or
- an extra board that supported HDLC (SCC card), or
- software that bit-banged the HDLC out of a single bit on an existing port.

It would have been a lot easier to build a packet station from existing equipment when ASYNC would have been used on the air instead of HDLC, with some character-based framing protocol such as SLIP, PPP (which of course was only defined later), or BSC.

How many times have I thrown multiport RS232 adapters back in the junkboxes at swapmeets, just because they had 16450/550's instead of Z8530's...

Rob

Considering that they need licenses for TV's too, it wouldn't surprise me if
that were actually meant to be a TRUE statement and not a joke. Technically,
even computers with a television reception/capture card need the TV license.

Hi,
does anyone have a picture of the top PCB of the Yaesu 730R, showing the
wires going into the plug on the PCB from the display board, or any info
that will help me to wire the display board back up???

TnXs
Mad,P

P.S
I have created a digital network over the 27Mhz C.B band, and i wondered if
anyone could explain why when the sun goes down, the signal gets worse
instead of better as i would expect, resulting in large packet loss.....

strange eh???

Of course they do. The license is meant to be a way to finance the public
TV network, and it does not matter whether you view it on a dedicated TV or
on your computer with special hardware...

We used to have this licensing in the Netherlands as well, but it was
abandoned last year, as it is now assumed that *everyone* has a TV and the

public TV network can thus be financed out of general taxes.
A similar system (with a lower fee) was used for radio.

With the "internet license", they would probably finance the public (government) Internet sites. That would not be so bad, because now they are financed by Microsoft, who have made sure that only people using Microsoft's browser on a system with a Microsoft operating system will be able to access them.

Once in a while, some government control is good to have. Especially when it is not from a government that thinks that short-term local economic benefits should prevail over long-term worldwide environmental problems.

Rob:

I hear you.

We could have had something much better than AX.25 as well, if more foresight had been put into it.

But I am hesitant to criticize.

Hindsight is 20:20 as they say.

Those early amateur packet radio folk ran with what they knew and what they
could pick up for free and they got lot's of folks involved in packet and
digital radio, who probably otherwise would still be analog folks..

You mean there are places in the world where you don't need a TV
licence?! ;-)

Our dear old BBC is still a public broadcast service, and it is financed
out of the TV licence fee. It's not as crazy as it might seem, because
it gives the BBC a level of perceived independence that wouldn't be
there if it was financed out of general taxation.

> Technically,
>even computers with a television reception/capture card need the TV license.

It's one licence per household, so you would only need a licence for a
PC TV card if it was the only TV in the house.

As regards the internet, I think we'll probably see more attempted
government intervention over the next few years, but hopefully that
won't go as far as making us have a licence!

Another possibly interesting data point.

During 1978 and 1979 several of us in the midwest were looking at using 2M for moderate haul data transmission. We looked at several variations of existing LL BBS protocols, and thought that something similar might be useful. I suspect we would have settled on exactly what you suggest: some 8 bit ARQ type protocol using ASYNC framing, perhaps derived from XMODEM. By the time I was able to get back to this project (in late 1982), it was clear HDLC was going to be what was used (smile).

It is actually in Washington state, just across the river, up on a mountain.
There is some possibility it has been replaced by an MFJ clone recently,
since I remember some mention of reliability and the cost of Snow Cat time.
So it may now be at a lower site in the same general area.

I have one TNC1 (in the Gucci cabinet) left. Has KISS EPROMS
in it and still works. Also have the 300 baud header for it. Might be
fun to put it on air on HF ... or maybe sell it on eBay as "Packet
Radio memoribilia."

Roger Barker <roger@peaksys.co.uk> wrote:

>Our dear old BBC is still a public broadcast service, and it is financed out of the TV licence fee. It's not as crazy as it might seem, because it gives the BBC a level of perceived independence that wouldn't be there if it was financed out of general taxation.

Do you think that makes much of a difference? This licensing scheme was (I think) invented in the fifties, when it would have been perceived unfair to tax everyone for the TV broadcast service where only the happy few would be able to watch it. Now, a TV set is considered to be standard equipment in any household (at least in any household where general taxes are being paid), so that aspect is no longer valid.

The independence, IMHO, mainly stems from the fact that it is funded by a means independent from the number of people watching the programme, or the composition of that group. So, they can transmit generally informative material, culture, education, opinion etc without having to consider advertising income.

In the late 1970's and early 80's, most hobby computers did _not_ contain a hardware UART and in many hobby computer the only "serial" interface was the cassette tape mass storage interface using Kansas City or similar coding. In those days, there were very few serial devices a hobbyist could connect to their computers, possibly a surplus serial printer, but that was all.

In many cases if you had some kind of serial interface, it was often implemented in software driving some I/O pin, since UARTs were quite expensive in those days. Implementing a software interface as asynch or synch was not a big deal.

>Later, the situation only became worse. Everyone had computers in the
>shack that were perfectly capable of ASYNC communications supported by
>hardware UARTs, but for HDLC they needed to use

This was the situation around 1990.

While agree that asynch would have been nice for initial experiments, but the capacity is severely limited with band limited channels. In asynch communication, it is essential that mark->space transition in the start bit is received faithfully, since this determines the timing for the whole character. In band limited channels and especially in radio transceivers intended for voice communication, the amplitude and phase response could be almost anything, messing up the critical start bit transition.

In the late 1970's, leased line modems and base band modems could be used with at least the double speed in synch mode compared to asynch mode. Remember this is long before they put equalisers into modems.

A synch link on the other hand has several transitions at the beginning of the frame in order to be able to determine the actual phase of the bit timing, thus averaging out most bit phase timing errors. After that it was only a question of long term clock frequency stability in order to maintain bit synch until the end of the frame, not too hard even for a 100 ppm crystal oscillator.

If asynch had been initially been used, it would have hit the same 1200 bit/s (or possibly already at 600 bit/s) barrier, which is due to the performance of most unmodified voice grade radios. When surplus voice grade radios become available, you could dedicate one for packet.

In order for any high speed packet system to be popular would have required that off the shelf radios that are capable of such speeds would have been generally available at prices of typical single band HTs or preferably in similar prices as surplus voice grade radios.

The Kenwood mobile and HT radios with build in TNC are moving in the right direction, but unfortunately, they were introduced a decade too late. At least for mobile radios with unlimited power consumption, this could have been implemented a decade ago.

I know, I had a computer in 1980 and indeed it did not have a UART. The UART was available at an extra-cost option (for which you first needed to buy an expansion cabinet). And the UART was not even able to generate interrupts...

But apparently it was decided that the interface between the TNC and the computer had to be ASYNC serial. The first TNC had an expensive HDLC controller, the TNC2 used two channels of a multimode controller that could do ASYNC and HDLC.

So, even if the system itself did not have a UART (and the original TNC design probably envisioned the use of a teletype or dumb glass terminal as a user interface), the radio side still is independent from that...

>While agree that asynch would have been nice for initial experiments,

>bit transition.

This would have been a problem and limitation with the first generation modems that did not demodulate synchronously with the bitrate. But the later higher-speed modems usually do. E.g. the widespread G3RUH modem does recovery of the bit clock, and clocks the data at the sampling moment. It even provides the receive bit clock, but this information is usually discarded and the receive clock is again recovered by the HDLC interface.

In fact the original TNC2 clock recovery circuit (the EPROM state machine) is a DPLL that looks at multiple bit transitions. This same circuit could be used to clock a D-FF that would provide a cleanly timed async signal similar to the situation with HDLC.

(and again, the async interface would discard the clock information and re-generate its sampling clock from the data, just as with the combination of a G3RUH modem and a TNC...)

Of course, the 20%+ loss of bitrate because of start/stop bits and framing protocol overhead would be a disadvantage of ASYNC.

>If asynch had been initially been used, it would have hit the same
>1200 bit/s (or possibly already at 600 bit/s) barrier, which is due to

>packet.

I think that when ASYNC would have been the initial air framing format, it would have been a logical step later to use it as a framing format between system and modem that is not necessarily used 1:1 on the air. E.g. to use FEC one would ship the async frame to an external controller that reads the data and transforms it into a frame that includes FEC information before sending it to the modulator.

Now that it already is so difficult to obtain HDLC from the system, most designers will not consider putting a system-side HDLC interface on their modem that just decodes the frames and starts from scratch just for the purpose of modulation.

Of course we DO have an ASYNC frame format. KISS. Too bad that it was forgotten to include a CRC so that it would be equivalent to HDLC when exchanging data over the air... in that case we might have seen stations directly transmitting KISS and comparing the two in a real life situation?

>In order for any high speed packet system to be popular would have
>required that off the shelf radios that are capable of such speeds
>would have been generally available at prices of typical single band

>HTs or preferably in similar prices as surplus voice grade radios.

Yes, and even when that was the case it would have been required that these would interface to the typical computer in a ham shack. Maybe a DSY modem with ASYNC interface, that simply attached to a COM port, would have had a better chance of acceptation than the existing unit that requires the use of some exotic "high speed" TNC or special SCC card to generate the HDLC datastream.

Today's computers cannot use the "old-fashioned" ISA SCC cards anymore. Nobody wants to spend the effort (as a hobby) or money (commercially) to design a new PCI-based SCC card. And even then, how long will the PCI bus last? In the meantime, every PC still has two unused COM ports on the back. We can connect it to a slow Z-80 based TNC2 designed over 15 years ago, that only is a nuisance because it messes up the timing, has badly designed hostmode interface protocols, and limits the datarate by its slow performance. Or we can use the soundcard and do everything in software. Not too many attractive options there...

When that part of the chain is already so weak, small wonder that so few "fast" radio solutions exist. Even when a faster modem+radio is designed, it is too difficult to use it for AX.25 packet.

What role could packet radio play in the new era of repeater linking via the net?

In a list of digital modes (this is a digital group), packet radio
is at the bottom, as a mode that gets much use any more.

If you're talking about cross-town, then no, there are easier
methods. If you are talking about across the state, then no,
the speed you can afford is too slow.

How about sending packet via the internet voice repeaters, and so
avoiding a direct wire link?

(I knew that one day someone would find a use for them!  ;-)

I had an S-100 based machine in 1979 that had a UART.
It was part of a combo card to do serial and cassette.
Made by Technical Design Labs (TDL). They also had
a great TDL Macro Assembler and Basic on tape. I ran
that to a serial printer that worked backwards (the letters
were behind the paper, and the hammer was blank and
hit the front of the paper). So with 2 UART ports I could
run an ADM-3 and the printer.

I wrote a complete word processor back then, as well as
household finance type stuff.

Probably over $2k invested over a years time.

Hell of a machine! glad to throw it in the dumpster when
the Atari 800 came out. Ported all the S-100 software
over. Took a long time to load all that crap with a cassette...
40 characters per line was not much worse than the ADM-3's
ugly 80 columns.

Actually it says "Telneting via internet to amateur radio band", the key word being "to". So going from remote location via the internet to a server that takes internet side to a radio interface to, say have the telnet typing go out PSK31 and from the radio side to the telnet. In essance, remote operation. So, either the telnet'er is a licensed ham, or it's third party and must be monitored by the stations CONTROL operator for transmitting operations.

[snip]

Hmmm, guess my Heathkit H89, with its four 8250 UARTs (used to talk
with the monitor, modem, and printer, amongst other things) was an
abberation - ditto my KayPro II, which had a complement of Zilog SCCs.

Dates: 1979, 1982. I've still got the KayPro.

regards,
Ross, ve6pdq

ps: I hold a Canadian "digital amateur" ticket, FWTW. It was a fun
thing to get.

In many places in the States, dog licenses are still required. In some areas,
certain breeds of dogs ("pit bulls" and such) are becomming illegal.

You are right, machines like that usually had one or more UARTs.
In those days I drooled over the brochures but I would never be able to
afford a system like that.

The "home computers" of those days (Apple][, Commodore PET, TRS-80)
did not have a UART. Apple used bitbanging (they did everything in
software even the floppy controller but they still charged most for
their hardware....), Commodore had a universal IO chip but I think it
was only a serial shift register, not a UART, and it was used for their
proprietary interface bus.
The TRS-80 (I had one) could be fitted with a UART but only after you
bought an expansion interface. I built my expansion interface, including
UART, myself (on prototype board).

Those were the big three of home computers. There were also others,
like OSI. They apparently were a fan of the UART and even used one
in their floppy controller :-)
(believe it or not, they wrote ASYNC data on the floppy tracks)

Heathkit used a USRT in just the same way; a Signetics 2601, AFAIR.

regards,
Ross ve6pdq

I have used the evaluation copy a lot and quite liked it. In fact, I was very close to purchasing it till I tried MixW. However, having tried the recent RCs of that package, I am not so sure... SkySweeper is certainly very configurable, but I have found that MixW almost always does as

good a job and even seems to be a bit better at decoding some very
weak signals. The main advantage of SkySweeper seems to be the
audio DSP features which can help pull out weak voice signals.

Get the demos of both and try them - MixW is not free either, but
it is a bit cheaper than SkySweeper and, for most people, I would
guess that its extra features would be pretty convincing

Martin

Hello,

I have installed the nice looking program EZSSTV. It works pretty
fine, but only for some minutes. Then the program crashs and I get
the DOS message "ILLEGAL INTERRUPT #6" with register dump. Sometimes
it crashs immediately after starting it.
I changed the mouse driver and some other things in the config.sys /
autoexec.bat - no success.
Amazingly EZSSTV seems to work stable in the very crude 640x480x16
mode - I'm using the univesa driver with the TVGA8900 card.
The comparator modem hooks on COM1, the mouse on COM2.

I hope someone out there can help me ...

Kay (DM2KL)

Hi there fellow warblers... MixW version 2.0 RC7 has now been uploaded to our website which is:
http://www.nvbb.net/~jaffejim/mixwpage.htm the following changes and updates have been made:
- Expiration date (for unregistered users) is July 1, 2001.

Added:
- Added CWR and FSKR transceiver modes to drop-down mode menu.
- Added <SPZOOM:n> (n=0.5,1,2,3 or 4) to set spectrum/waterfall zoom.
- Spectrum/waterfall shift position is now saved (and restored :-).
- Added <INV>, <INVON> and <INVOFF> macros to quickly change inversion.
- 8-bit encoding in MT63 mode is added (see MT63 settings dialog),
- Contest Settings: added Check Dupes regardless of Band or Mode

check-boxes.
- <LASTCALL> macro (not in list), unlike <GRABCALL> captures last call appeared on the RX screen.
- CW weight correction (in 1ms intervals) to compensate CAT CW delay.
(+1 to add 1ms delay, -1 to subtract 1ms, and so on.) See CW settings dialog.
Bugs fixed:
- Auto Search Log name and QTH bug is fixed.
- AFC in MFSK in full duplex mode stopped.
- <ALIGN:nnn> on LSB bug is fixed.
- Several contest bugs are fixed, but contest mode is to be re-written.

For those of you who are not familiar with MixW 2.0.. MixW 2.0 is the Shareware version of our very popular FREEWARE DigiPan and employs the same easy pulldown menus and easy to read illustrated Help files and easy setup. Unlike DigiPan Mixw is able to do ALL digital modes such as RTTY, CW, PACKET VHF /HF, Pactor RX, Amtor RX, Pactor FEC TX/RX, Amtor FEC TX/RX. PSK, QPSK, FSK31 MT63, MFSK, Throb, Hellschreiber, SSTV, Voice keying (call CQ or anyother message in your own voice) Contest logging, regular logging, CAT and Rotator control. plus much more.. Happy Warbling and 73 ... Jim, WA2VOS

Gary,

Check out the PkTerm '99 article in this months (July) 73 magazine by Jack Heller. He describes the use of it in detail.

No mods to the PK-900 needed, since it'll sue the PK-900 for the keying circuit. You'll still need to have your psk audio coming from the sound card, but this way you save a serial port for other uses and can change between all the Pk-900 modes and PSK-31 in one program, with the click of the mouse.

Rick - W4PC

Hmm.. oi!
What about the VADCG V1, V2 and V3 protocols?

They were popular here in Sydney for some time, it took a good while to convince those of using them to move to AX.25.. As it happened it was probably TCP/IP that convinced us in the end to move..

There are a good number of VADCG TNC+ machines still operating perfectly around Sydney.

Terry

  Would that I could, but 73 is nowhere to be found in the New Jersey
area (bookstores or otherwise). Wayne's site has nada on even subscribing
to the mag, which I used to do, but don't anymore for a variety of
reasons. And near as I can figure out from an Altavista search, 73
doesn't have a website of it's own.

[snip]

I'm curious... How is your "digital amateur" ticket different from an "analog amateur" ticket?

And... what is different about the knowledge base required in order to pass the examinations?

Is CW considered to be a digital mode? Or is it just a "binary" [or maybe "ternary" (dot-dash-space)] analog mode part of the analog amateur ticket?

Heh, heh... I always like to believe that both wireline and wireless communications started out as a digital mode [Morse code is digital] and then regressed to analog modes for decades with the advent of the microphone and analog modulations, and that in the modern era we are returning to our original digital roots!

They stopped paying for articles for awhile. I finally got paid a year late. Wayne used to sneak in late at night to the business, and a private detective finally served him with papers. Wayne has a rule that his assistant editors (the people that do all the work) be as crooked as he is. Not many last. I used to take his magazines and put them in the bridal section of the bookstore. With zero sales, the book store dropped it.

For all his computer bravado, he actually hires people who are not skilled in anything besides formatting the articles on an Apple computer and sending the files to the printers.

That's why they only accept finished, ready to print articles. The editors don't have the time or skills to take a so-so article and make it correct. There is no retainer of a peer review, thus many articles have simple math errors, or major electronic theory lapses.

The World Wide Web holds no interest to them. Wayne is just a windbag, and none of his "actual" predictions have panned out. Anyone see Cold Fusion take over in 1995? How about 2000? If you took all his editorials and made two stacks: 1) editorials about me, and 2) editorials about others, the 1st stack would be 500 times higher than stack number 2. He's broke his arm several times patting himself on the back, and not paying the true author.

People need to stop sending them money, and let the bastards die, like all the authors they screwed.

Gary,

I am not really sure it is very accurate to say that you are using your PK-900 for PSK31. You are only using the PK-900 as a PTT keying circuit! The PK-900 does NOT have the hardware to properly receive or transmit PSK31! You are using your computer with its sound card as the MODEM!

In other words, you don't need PKTERM to run PSK31. You can easily use any of the GREAT FREE software programs like DIGIPAN to operate PSK31. (For DIGIPAN see http://members.home.com/hteller/digipan/).

If you want to key your rig, you can use VOX. In other words, you can operate PSK31 RIGHT NOW!

But if you want to use PTT to key the rig, you will need to either build or buy a simple ONE transistor keying circuit OR you could use your PK-900 to key the rig (using PKTERM software).

To operate PSK31, the MOST important thing that you must do is PROPERLY interface your rig to the computer soundcard using some ADDITIONAL hardware typically called a SOUND CARD INTERFACE! Most use audio isolation transformers to break up ground loops.

The PK-900 or PKTerm 99 will NOT PROPERLY INTERFACE your sound card to your rig. You will likely have ground loops and transmit with a VERY dirty signal.   Many of your fellow Hams will not be impressed.

If you want to buy a sound card interface already built, look at

1. RIGBLASTER
2. The one offered by the folks who made DIGIPAN (see http://members.home.com/hteller/digipan/)
3.   Bucks interface .. see www.packetradio.com

Most Sound Card Interfaces ALSO have a PTT keying circuit.

I would first build or buy a good sound card interface and use one of the great FREE programs like DIGIPAN to get into PSK31 (or SSTV etc). If you want to buy PKTerm, go ahead. I hear it is a good program.   But I would NOT buy PKTerm just for PSK31. You money is better spent on a good sound card interface.

Rob

> "analog amateur" ticket?

Different exam, different privileges. Of course, I went on and did CW and I'm currently an Amateur Advanced (full privs all bands). Digital is no longer offered, but I've still got the certificate.

> And... what is different about the knowledge base required in order to pass
> the examinations?

The "analog amateur" basic is a 20-question bingo card style exam. The digital was a three-hour essay format exam, it was a very good idea to read Stallings, Nyquist, and some Hamming before showing up, and you really did need to do some math :). Oh, and the obligatory legal/regs stuff, which in Canada comes down to "the Minister has godlike powers" ;).

> Is CW considered to be a digital mode? Or is it just a "binary" [or maybe
> "ternary" (dot-dash-space)] analog mode part of the analog amateur ticket?

Have no idea - doesn't appear on either the Digital or the Basic. CW endorsements are orthogonal to the Basic/Advanced exams. I'm mode agnostic, and have no interest in flogging that particular expired quadruped.

regards,
Ross ve6pdq

Rob,

In the demo mode of PkTerm '99, there is full access to the PSK-31 interface, sans the TNC for keying, so the PSK-31 in PKterm works like Digipan and the other freeware in that respect, except PKTerm was designed for the ease of use of switching between the modes of the PK-900 (PK-232, DSP-232, DSP-2232 etc), with the click of the mouse and other advanced features like Autologging with Log Windows and DXBase 2002, syncing a window with Log Windows, DX4Win and Logic 5, and much much more.

And Timewave is working on hardware interfaces where the sound card can be pluged directly into the TNCs, so that no other hardware is needed. Audio isolation is included in that hardware.

MFJ already has this with our MultiComm Host/MultiMode product. They have created a cable that plugs into the modem disconnect header on the MFJ-1278b. By using this and a cable from the ext speaker jack on the back of the TNC, going to the sound card, the audio passes through and is already isolated from the radio with the circuitry in the TNC!

So Gary can operate PSK-31 *RIGHT NOW* as you said, but he can do it with PKTerm '99 in demo mode at no charge. The value added are the advanced features of PkTerm '99, Pacterm '98 and MultiCom Host/Multimode.

Best

Rick - W4PC

Perhaps some news from Timewave will fuel this fire a little!

This may be a bit premature, since production units for the PK-900 will not be ready for about 3 months, but we are in the process of designing an internal sound card interface for the PK-900 that will allow you to run either sound card modems (like PSK31) or the existing PK-900 modems (like RTTY or Pactor) . The modes are software selectable from PK-TERM'99 and do not require changing cables to switch from the sound card to the PK-900 (or vice versa). If you are running AFSK you do not need to change any radio-to-PK-900 cabling to use this new interface and we supply the sound card-to-interface cable with the interface kit. The new interface uses transformer isolation and, of course, we take advantage of the existing PTT control circuitry and software.

The PK-900 project is scheduled for shipment in September, 2001. Prior to this (in July - already about a month late!), we will introduce a PK-232 internal sound card interface with the same characteristics as the PK-900. You can check our website (www.timewave.com) for more details as they are released.

73 es tu,
Randy Gawtry, K0CBH
Timewave Technology Inc.

Dog licenses are required as proof of rabies vaccination. Plus the
number can be raced in case of lost pet.

Ross:

Hello.

[snip]
> The digital was a three-hour essay format exam, it was a very good
> idea to read Stallings, Nyquist, and some Hamming before showing up,
> and you really did need to do some math :).

[snip]

Thanks Ross, good way to describe the sylabus for that most famous and formidible digital amateur exam. Heh, heh...

Here's some comments on yours...

Stallings, who's he? Cream skimmer, what did he do? What's that old sayin, "them that can does, them that can't teach." ;-)

Nyquist, bandwidth required for symbol rate support BSTJ, 1928! Nice piece of work but dated. Harold has been long gone to the great anti-aliasing filter factory in the sky. God love him. :-(.

Gibby and Smith were more definitive on noise free capacity in 1965.

Hamming, source codes circa 1952. Richard, now still an adjunct at US Naval Post Graduate School. Monterey, CA if I'm not mistaken. But Lempel and Ziv have since gone far beyond. ;-)

What, no Kleinrock needed for that exam? ;-)

I'm surprised since... If I recall correctly, Dr. John DeMercado the former Canadian Director General of Radio Regs who instituted the "digital amateur" ticket in Canada, was a former student of Leonards at UCLA.

Re: queuing... I was thinking that you would at least have needed to take a look at Cooper or Kleinrock before sitting that essay exam. But then Bob was a Bell head not a Net head like Leonard.

Well I for one an impressed that, at least for a while long ago in Canada, there once was such an examination to enter our proud hobby.
Congratulations on passing that exam.

Ross do you know approximately how many "digital amateur" tickets were ever issued?

Best...

-Peter K1PO

Randy,

Anything like this for us DSP-2232 users?

I've read all the comments so far in this thread, but I'm struggling to understand how this works, and I've no way of getting hold of the 73 article, so -

A normal PSK31 / PC sound card system has the following connections:-

1. Rx audio from the radio to the PC sound card, preferably via an isolation transformer.

2. Tx audio from the PC sound card to the radio, preferably via an isolation transformer, and essentially via an adjustable attenuator pad, unless you're competing for the worst IMD on the band!

3. PTT from a PC COM port handshaking line to the radio, via an NPN

transistor and a resistor, or via a more sophisticated isolation system.
(Obviously, if you use vox, this isn't needed.)

So which of the above does the PK-900 replace?

Sure, and frankly I lump him with Asimov as `expert on whatever he's
read lately'; but a good quick read and overview. And I found a copy
in the stacks.

> Gibby and Smith were more definitive on noise free capacity in 1965.

Must go read them. Tnx.

> What, no Kleinrock needed for that exam? ;-)

My day job at that time was as a campus Unix & network admin; busman's holiday!

> Re: queuing... I was thinking that you would at least have needed to take
> a look at Cooper or Kleinrock before sitting that essay exam. But then Bob
> was a Bell head not a Net head like Leonard.

AFAIR, there was a requirement to calculate the capacity of a slotted
Aloha from first principals, which I did by rote.

> Well I for one an impressed that, at least for a while long ago in
> Canada, there once was such an examination to enter our proud hobby.
> Congratulations on passing that exam.

Oh, you didn't need to have an M Eng. to pass by a long stretch. I
think I spent an evening at the books (hence the 'PDQ' in my call.)

> Ross do you know approximately how many "digital amateur" tickets were ever
> issued?

Oh, less than a thousand; I & Sc Canada would know best. It's a
historical curiosity nowadays - we were all grandfathered into Advanced.

regards,
Ross ve6pdq

Ronger

With the mod that Timewave is doing for the Pk-900, all 3. The sound card will plug into the TNCs external modem connector via a cable and use the TNCs radio out connectors to the radio.. no other circuit neded since all the isolation will already be in the TNC.

So all three, sound in, sound out and PTT will be handled by one cable from the TNC to the radio, and the sound card audio pluged into the external modem connector...a clean implimentation by the Timewave guys, and switching between the internal and sound card mode(s) is handled by PKterm.

We haven't had a chance to look at the DSP-2232 yet, but the possibility certainly exists. It will be at least a couple of weeks before we have chance to evaluate it. If we decide to do it, we will post a note on the website.

Reminds me of Kurt Vonnegut's description of the fascist mind as a "cuckoo clock from hell" that works perfectly until a certain subject comes up... Since there's a missing cog or two in the mechanism in connection with that particular subject, the clocks' hands spin around back and forth like crazy, and the little bird flops in and out at random, until the subject of discussion finally changes and the mechanism once again goes back to functioning normally. - For a while.

Shit...

Kurt Vonnegut would have found such a clock abnormal
when it wasn't schizophrenic.

Vonnegut also wouldn't know a Fascist, if they drove up in a
truck and pissed in his driveway.

I have heard there is a radio/tnc combo that does the PSK31. Has anyone else heard of such a thing? If so, who makes it?

Enrique

... And you of course see that the clock is "normal", and so disagree with Mr. Vonnegut.

>
> Vonnegut also wouldn't know a Fascist, if they drove up in a
> truck and pissed in his driveway.

Well, actually, they drove up in a truck and dragged him off to a prisonor of war camp. But, being the literary genius that you are (a legend in your own mind) then of course you are already aware of this.

Surely you are just ACTING like an illiterate nimcompoop, all mouth and no brains.

No wonder 73 magazine told you to take a hike. I don't know about anything else Greens does, but there's ONE thing Wayne Greene got exactly right.

I'd have had your sorry butt bouncing off the sidewalk too. Twice.

All done whining yet? It makes you kind of obvious... You might as well have "LOSER" tatooed onto your forehead.

As psk31 usually uses the computer sound card , are you sure you are not confusing the radio with the packet tnc built in ?

Rob:

Was Harold a Canadian?

AFAIK... Canada was the only country to ever institute a "digital amateur"
exam and ticket.

And...  as Ross has shared with us the exam was not a multiple choice cake
walk

Too bad it's gone...

It seems like the Canadaian regulators regressed and watered it all down
again as Ross said, and...

To add insult to injury according to Ross they grandfathered all of the
licenced digital operators over to analog to boot!  :-(

Keep that digital certificate Ross and show it to your great grandkids...

-Peter K1PO

Hello,
I've written with a friend a teletext server for packet.
It need Linux correctly configured for packet with the kernel.
This version support multiple connection, some variables, an history of the
10 last page, direct connection, telnet connection, possibility to create
an alias to a command or a page...
look at http://xtsl.sourceforge.net

bye, 73 from Florian

Processor? Memory?

Running for a while and then crashing suggests that the
program is falling behind in its processing. The usual
suspects are a too-slow processor, and not enough memory.

The SCS PTC II, PCT IIe and PTC II pro are DSP based  modems (TNC's)  that
implement many modes including PSK31.  You don't need a computer with a
sound card for PSK31.  see www.scs-ptc.com

The new KAM XL will also do PSK31.      www.kantronics.com

The NJ QRP Club has 20m and 80M radio's (warblers) that are designed for PSK31 only. Designs have appeared in the ARRL QST magazine in the last couple of years.

The program crashs too when not in the receiving mode, for
instance while reading helps or loading pictures.
I have insulated two conditions for the crash as yet:

1. the univesa driver must be loaded
2. the program reads/writes to/from hard disk

Some suggestions yet?

Kay (DM2KL)

"ILLEGAL INTERRUPT #6" indicates an "illegal instruction".

This could mean the program contains instructions that your processor is unable to execute (i.e. it requires a Pentium, or it is uses some obscure instruction that your processor, which probably is not a genuine Intel 486DX but an AMD or other clone, does not implement).

This can also be caused by problems with your hardware. The data read from memory may be bad, causing the processor to interpret garbage as instructions.

In the 386/486 age this often happened when the cache controller was not entirely reliable. You could have a system that ran many programs OK, but when running a program that did a lot of memory accesses in certain unfortunate patters (e.g. walking through the entire memory) it suddenly failed and returned bad data.

I have once wasted a couple of weeks debugging my packet radio program which crashed on a certain busy node, only to find that the problem disappeared when the operator disabled the cache in the BIOS setup.
Of course then the system was much slower. The motherboard was replaced and the problem was gone.

A good idea, Bob. I will check my memory/cache with MemTest-86 and
turn off the cache for some further ezsstv tests.

This might be a dumb question, but are the frequencies used for the
Field Day bulletins the same as the normal ARRL bulletins(CW and RTTY is
what I want)? Also they say that they will be sending it via PSK31 this
year. I assume that this will be on 14.070(and/or other psk31 freqs on
other bands), correct? The ARRL doesn't make any mention for PSK31 on
its website for bulletin frequencies. de WO5M

I agree that the DSP based modems are not cheap but if you want to operate PSK31 when backpacking etc, the TNC with a small dumb terminal like a Palm Pilot is a great way to go.

There is probably very little difference in performance between a DSP based modem and a sound card for PSK31, etc. I don't see much between my PTC II and the sound card on PSK31.

But if you ant to operate the BURST modes (e.g. AMTOR, GTOR, PACTOR etc) under Windows, the TNC is the only way to go. It is virtually impossible to implement the BURST modes under Windows with a sound card.

Anybody know where I can find sound card spectrum analyzer software? I need to look at receiver audio in the frequency domain. My old $10 World War II scope does fine in the time domain but the fire bottles are not smart enough to do the math and convert it for me.

Also, how can I use the sound card as a low distortion audio generator? Any software out there that plays in Windows... or DOS? I could do it with an opamp and a few components but I'd rather do it with computer controlled D-to-A. There must be a single sine wave programmed in the sound card chip. Just hope it is not locked to the musical scale.

Thanks,

Harvey, K5LJM in sunny Sun City, AZ

We are planning on running PSK31 at our Field Day site. We are not use to using it, and it will be kind of a playing around and testing phase for us. I know there is a lot of band that digital can be used, but is there any special frequency that you can find someone on the bands?

Yep, they are commercials. Like the others , I really don't hear a whole lot of ham digi stuff on 30m for some reason. Dunno why, it's a great band. About my favorite for CW. MK

I have a Code3 demodulator from Hoka. For a year ago my hard-disk
have a crash and my software and the key on it was goin by west.
Ofcourse I have the software in a other copy but it never works witout the
special key.

Do any body now how I can find a new copy without to pay $80.
/Dan

All Linux distributions come with sound card FFT software. It's not
difficult to roll your own: FFT is a textbook algorithm.

> Also, how can I use the sound card as a low distortion audio generator? Any

There are no waveforms programmed in to any sound card
I've ever seen. You generate the samples and blast them
out yourself. There may be software out there, but it's
dead easy to do it yourself.

DOS? Windows? They just make things like this difficult.

```

Laura,

Thanks for the advice. I have Linux Mandrake 7.0 on the shelf, still in the box. Maybe with lots of studying and some help from my friends, I could get one of my old computers up and running FFT software. But first, I need you to point me to the starting places. My last programming was assembly language, Fortran, Pascal, Basic and Cobol on minis and 8080 machines... did quite a bit of real-time control programming for military systems. Later on, I had other folks to do it for me. I've looked at C++, Visual Basic, Access, Java, JavaScript, Flash, etc. but haven't the foggiest idea how to write machine relocatable code for a '486, Pentium, PII or PIII.

I need to brush up a bit on my FT math as well. We mechanical engineers who graduated in the late 1950's did not study much higher math. That's not a piece of cake, but it is a mountain I can climb.

The big black vertical cliff is the hooks for the sound card. Where can I find out how to command the D-to-A's and A-to-D's using the Intel spider? I would like to do it in Windows as well as Linux and whatever you recommend.

Sounds like this is old hat to you. Will you please post this on the newsgroup? I'm sure there are others who would like to learn more about the subject.

I hope you can show me that it is "dead easy to do it yourself."

73, Harvey K5LJM

Ralph,

This is a great site. I can spend weeks checking out all this stuff. I'm glad I'm retired. I could get rather frustrated otherwise with all these goodies.

Thanks,
Harvey, K5LJM

Alan,

These are great... just what the doctor ordered for looking at the audio out
of my receiver. Nice to have multiple timed samples.

Many thanks,

Harvey, K5LJM

Then you have missed the "wavetable" soundcards. I still have two "Gravis Ultrasound" cards in the junkbox. You downloaded waveforms and amplitude shapes into onboard RAM and the card could, without any CPU attention at all, "play" these waveforms forever. It could also, with only very little CPU effort, play formats like MIDI and MOD. In fact you only gave it a sequence of "notes" to play via the bus interface and it would generate the waveforms (both the shape of the individual cycles and the way in which they changed over time) all by itself.

Such a card would be able to generate FSK with only very little effort, and would also be a programmable function generator.

Cards like this were also produced by the more wellknown manufacturers like Creative, sometimes with the wavetable data in ROM (not as flexible).

They died out when the game programmers and computer users switched from MIDI and MOD-type audio to MP3 and other compressed "live performance" audio.

Actually, most modern ones have some wavetable MIDI synthesis
built in, which does mean waveforms in ROM (or RAM).

It will depend on the operating system you are using.
Some of them do provide functions for this kind of access (e.g. Linux,
Windows), and it will not matter what card you have.

In other environments you can sometimes install a function library from the
manufacturer.   Details will then depend on the card.

When you are writing for a stanalone system and not using any OS, you will
need to get technical docs from the card manufacturer, or from the
manufacturer of the main chip on the card.

I want to run jnos (or Tnos) on my linux box. I have a kpc 9612 dual
port tnc, and need to know the syntax of the attach command that will
activate both ports, Can someone help?

The only ones I've ever used are the cheapest, nastiest ones I can lay my hands on. Which are just what you want for digital ham radio stuff...

I can think of lots of applications for wavetable synthesis, but in this day and age processors are fast enough to do such things in software, and usually do it better anyway.

You might try a wire antenna (dipole, Zepp, inverted V, etc.) or loaded yagi tuned specifically to that frequency and configured in such a way as to reject other signals from unwanted areas. (Such an antenna will take up near an acre!) The Antenna Handbook (ARRL) has much information on these types of antennas.

Greetings and Thanks for reading this....

*** I am writing this on behalf of a fellow amateur, who is not internet operable. Anyway:-

As mentioned in the header- With the Installation of RedHat 7.1, ALL is working fine until after the install of kernel, just prior to start installation RPM's his system install crashes and hangs. The install is APC Pocketbook distro of RedHat 7.1.

His system is:-

Edge K5/100MHz
64MB RAM
** Using 3 HDD hda [2GB], hdb [2.2GB], hdc [1.6GB] **

Many thanks in advance if you can help with this problem, as
wishes to have AX25 under RedHat 7.1 Working ASAP. Instead of
Windoze !!!!!!

Consider the device connected to a hub.
Like I said ... it's usually true ... but not for the device I proposed.

Exactly.
I would say "appropriate application(s) on appropriate host(s)"
since broadcast protocols might be in use on the radio side.

At the application level there would be commands such as "attach/detach"
or "seize/release" and "check device availibility" ... and many more.
The device might control several radios.

I tend to think in analogies, thus the use of the ethernet analogy.

Picked that one because I'm familiar with it, there are standard
interfaces, most places these devices would go already have
ethernet network in place.

So we are desiring a gadget that will replace another gadget
that many people have already abandoned as an useful part
of the hobby?

I don't mean that in a snide way, only that a mere modernization
of the interface (USB, Ethernet, Appletalk, etc) will somehow
drive a new product sales leader.

I am still not convinced we (the hobby) have any data to transport over any new interface system, driving an old modem. This is a hobby of voice and keyboard types, and not many are interested in providing end to end infrastructure. Many of the people who set up nodes in the 80's, found that it became work, not hobby.

I think the way to go, for something of this product type, is to find a single-board computer with an ethernet and sound card (audio) built-in. As most things are Web enabled, so should this gadget. Controlled by a Web page (sound card baud rate, FEC mode, etc), with XML to feedback signals.

I did a web search, but there are about 1000 Web enabled SBC devices, and none of them quote prices :-)

Take a look at: http://jstamp.systronix.com/

You may want to take a look at http://www.ftdichip.com/, especially at the FT8U232AM. It is a high speed USB interface (12MBit) with a serial UART that is designed to replace the RS232 interface chips in a legacy product (eg. a modem or TNC!!).

At the host end (drivers exist for Windows and Linux at least!!) it looks like an extra serial port by hiding the USBness from the application. This gives you an immediate 2 magnitudes of speed improvement over a standard serial connection and USB cards and hubs a real cheap (if you don't have enough in your PC already).

With PC CPU power as it is now, all the clever bits can be done on the PC (HDLC encode/decode, CRC etc) as well as the channel access.

We're (Thames Valley IP USER Group) are looking at producing the next version of our 9k6 modem with one of these chips on, all surface mount and about the size of a book of matches. The drivers already exist for Linux and Windows (SV2AGW packet engine) which would require only minimal changes to operate with the USB interface.

Not as blindingly fast as you are looking for but maybe the idea is working the correct way...

Another product fro mthe same people has an 8 bit parallel output to interface to an SCC type of chip perhaps via a small fpga? (or maybe the fpga can do all the hdlc bits as well as in the 78k Baycom design)

Actually it was worse than that. Not only did most development depend heavily upon a very few "movers 'n shakers" who footed most of the expense, did most of the thinking, and basically all of the work, but at about that same time these "movers 'n shakers" were starting to burn out, they were suddenly flooded with demands for upgrades to high-speed, which was both financially and technically over most of their heads. Nobody helped, but they all complained. The demands for high-speed only served to "speed up" the burnout process. This national burnout process was accelerated yet again by the "LandLine Lid" problem, which undercut the motivation of Hams interested in amateur packet radio networking.

But even without the sudden demand for high-speed and without finding themselves "routed around" by LandLine Lids, it's my feeling that the US packet net would have collapsed anyway. All those things did was to speed up an inevitable process. The worst you can say is that those problems stole away time that might have been used to learn and adapt.

Almost the whole network (in the USA) was run as if it were a bunch of isolated repeater organizations, with hardly any original thought applied to educating, financing and organizing for the express purpose of packet radio networking. So, as you said about many (I'd say most) of the people who set up nodes in the 80's, it became work, not hobby. This is pretty well the inevitable result of applying the "repeater club" organizational model (with it's heavy dependence upon the efforts of a talented and well connected few) to the much larger, longer term, and more complicated task of building, maintaining, and upgrading a terrestrial packet network.

Have you looked at Ke5fx 10Mbps link?. http://www.qsl.net/ke5fx/#uwave
It's point-to-point, but isn't easy to have multipoint-multipoint RF links
at high speeds with CDMA.

Anyway, the best is enemy of the good.

> drive a new product sales leader.

Not my goal.

> I am still not convinced we (the hobby) have any data to transport
> over any new interface system, driving an old modem.

What "old modem"? Don't think I was very specific about
the modem, other than to mention 56k and T1 data rates,
as well as some of the existing HF protocols.

> This is a
> hobby of voice and keyboard types, and not many are interested

> set up nodes in the 80's, found that it became work, not hobby.

Then they would not be interested ... unless there was new stuff.
We are not going to get new stuff with the same old controllers
with built in 17 year old interfaces and applications. Which is my point.

Can't do new stuff until we have some "less boring" hardware.

I have noticed the same signals on 30 meters. Sometime time ago another person posted the same question. I believe the answer was the stations were commerical using a wider shift and encryption.

That is the best answer I could give at the moment.

If I remember correctly, the QPSK mode has twice the bit rate, and fills
the extra capacity with FEC (forward error correction). However, QPSK mode
of course requires a higher S/N (signal to noise ratio) than BPSK, and
the FEC isn't strong enough to compensate. Overall, you end up with the
same bit rate and you need a higher S/N to do it.

That is interesting, as out here in the midwest all we see is APRS. The rest of packet is dead. What kind of data do you have?

> What "old modem"? Don't think I was very specific about
> the modem, other than to mention 56k and T1 data rates,
> as well as some of the existing HF protocols.

The higher the speed, the more line of sight. The more line of sight, the more number of nodes. I put together a wireless link that operated at 1.6 Mbps (not quite T1, as it was semi-full duplex) Spread Spectrum. With a 24 dB parabolic and hardline, I was able to get the cost down to $1200 a node. I was the only person that thought this was cheap. But it does all you require, as it had an Ethernet connection, and if you special order the Australian ROM it will stay within the 2.4 GHz Ham band (Proxim 7921):

http://www.proxim.com/products/rl2/7920.shtml

These are 1/2 Watt Spread Spectrum radios. But these are Frequency Hoppers, which have no processing gain, something I would like to try next is the Direct Sequence stuff. But due to residential rooftop siting (not 100 foot towers, which don't exist unless you build them anyway) was only able to get 6 miles between hops.

> Can't do new stuff until we have some "less boring" hardware.

Spread Spectrum is not boring, the speed is very acceptable, but it ain't in the $75 class of most repeater builders and 1200 baud node builders :-)

The reason I am pursuing a 4800 or 9600 baud digital voice project, is for the reason that you can use a $75 FM repeater, and an Omni antenna. By multiplexing small amounts of data, or allow data bursts to fly alongside digital voice bursts, I think this would be exciting to a generation that was born after the invention of the Cellular Phone. This is the type data that would interest kids today (not to mention that with FEC, that the EOC's might be interested in it as well). The combination of voice and data (alphanumeric pager type data) would be a boon to the hobby, and I think it would sell. The new Hams we want to join the hobby, were born in 1985. What is that target population is interested in, is the question. We can ignore them, but without new blood, Ham radio population will continue to wither, and then be assimilated.

PSK represents only the physical transport layer. ARQ, or any other protocol, is at another layer in the protocol stack. Have a look at the OSI network model for more info.

As an aside, the whole issue of error-correction/recovery isn't the real issue. Anyone out there heard of ALOHAnet? It was the original concept that evolved into Ethernet and how CSMA/CD came into being. It was developed for the same purposes we're talking about here, i.e., using PSK31 as a protocol transport.

Which is a very unique result. In the other context, those who used landline BBS's (no radio ports) also went through a period where technology evolved, first from 2400 baud to 9600 baud to where we are now at 56kb for modems and even higher speed alternatives. In that arena, both users and sysops actively upgraded their modems, and apparently did so without any burnout whatsoever. Costs were also more reasonable. Even though many BBS's were gone by the time 28.8kB modems emerged, the Internet itself kept the development trend going.

Therefore, I believe that part of the problem is that packet never reached its "critical mass" for this technological evolution to occur with wireless like it did with wireline - perhaps until now. However, now there's a problem: There are many companies interested in wireless services (and I don't mean "plugging a device into a cellular or PCS telephone), yet the hardware for those services does not readily avail itself to our hobby - due to REGULATION. Although some parts of the regulations are quite liberal, the spread-spectrum rules are not, and that's what the commercial developers are using (incompatible SS). Content restrictions certainly do not help either.

For your last paragraph - I disagree - only in that comparing an area to any sort of organization implies some sort of local homogenealogy in any given area; a state that was often missing in many parts (at least, in the part of the U.S. that I'm in). There was no organized network structure at all. Other areas might have tried (some succeeded; some failed), but I believe that there was even more disorder than what you state.

Any sort of network requires cooperation. Cooperation is very hard to find in a hobby where "everyone is encouraged to do their own thing."

Can you be a bit more specific about what amateur data you have in
mind that require T1 or WLAN speeds ?

I hope that you have in mind something else than running the BBS feed
with a higher speed :-). Anyway, I guess most T1/E1 speed applications
would have something to do with real time audio or real time video.
These are quite critical about the latency, so some sort of QoS
concept may be required. This may even have implications how the
interface between the PC and the device is implemented.

Had to chuckle over the following. Many of us were zipping along at
300 baud with our Apples, Commodores, etc. before IBM released the
first PC. 2400 baud was only a dream then.

Web pages (web based database access applications) are one example.
We have some running here, but 9600 is simply too slow to be interesting.

Spectral data ("See what my radio hears") and digitized audio.
Digitized video ("Look at my backyard").

"Hey Ken, I have an update to SNOS, will ftp it over to you."
Takes 30-60 minutes at 9600 baud.

More hams doing more things, needs more bandwidth.

> I hope that you have in mind something else than running the BBS feed

Yes, see above for just a couple examples we have played with.

> These are quite critical about the latency, so some sort of QoS

I expect most of these applications will run over tcp/ip, so the QoS
issues would probably be handled at that level.

I also assume the device could have a reasonable amount of memory,
so that one could, if one wished, place the tcp/ip stack and related
buffering, flow control, and QoS decisionmaking into the device.

But I'm not interested in that yet ... first I need a dozen or so devices
to play with (smile).

Got you beat :-) I bought a radio shack 110 baud modem,
and used it for over a year until the 300 baud prices fell.
I had a BBS on my second line, and I tried to sell this to
the Tactical Air Command who only laughed. Many years
later they started using a BBS for remote radar sites to
drop their status and personnel performance reports. Saved

a bunch of personnel time retyping that bull. I was ahead of
my time by about 10 years :-)

Must have been about 1978 or 79, as I was taking this new
fangled Unix course at OU (BSD 2.9 on a PDP-11/73), and
I considered C language a step up from the PDP Macro
Assembler the USAF was using :-) We used to pore over
the Unix source and wonder why it even worked, as everything
was an integer then, and pointer and integer swapping all over
the place. Take a look at the PDP-11 Xinu book, boy that
book made all the same shortcuts. Still have my Lions book! ha.
I always wanted a PDP-11, but the PC and a C compiler
put it to shame. Bye, Bye DEC...

While I agree that 9600 bit/s half duplex is useless for any practical web applications, 9k6 to 14k4 full duplex connections are quite usable for mainly text based pages. Speeds in the order of 100 .. 250 k should be more than sufficient for most web pages. There are of course pages with a lot of bells and whistles requiring unlimited throughput, but these pages usually lack any usable contents anyway :-)

>Spectral data ("See what my radio hears") and digitized audio.
>Digitized video ("Look at my backyard").

You could take that idea a step further and build a remote controlled club station in a place with low noise levels and no antenna restrictions and let the club member access this station from home, work or from a parking lot via a microwave connection. With ADCs and DACs intended for the "high end" audio applications with 18 to 24 bit, 100 .. 120 dB dynamic range and up to 192 kHz sampling rate, you could broadcast the whole band (such as 30 m) or a full segment to multiple end user stations and letting them pick the actual transmissions they are interested in.

>"Hey Ken, I have an update to SNOS, will ftp it over to you."
>Takes 30-60 minutes at 9600 baud.

At 250 kbit/s those transfer times would be reduced considerably. I don't expect you to generate a new version every 5 minute :-).

The reason that I am quite sceptic about T1 and above speeds, are that in order to use some simple modulation methods, a more or less clean line-of-site path are required with no obstacles in the first Fresnel zone. Unfortunately such paths are extremely rare in amateur radio systems.

In order to be practically usable, the data transfer must work well in non-line-of-site paths with lot of multipath. This will require a more complicated modulation, such as OFDM or spread spectrum (no doubt a WLAN card with a transverter down to 1.3 GHz and a medium to high power transmitter would be an interesting thing). The other thing is that the power requirement will be quite high when operating at non-LOS paths. Increasing the data rate will also require increasing the transmitter power levels.

You can get a feel how well the signal will propagate in non-LOS microwave conditions e.g. by using an HT on the 23 cm band. However, to get similar distances with T1 speeds, a bandwidth about 100 times wider is required and hence, a transmitter power 100 larger is also required. Thus, we are in the 10 .. 100 W power range, which becomes quite expensive on 2.3 GHz and above, not to mention that using such power levels in a portable setup would be quite problematic :-).

IMHO, in order for any microwave digital transfer system to gain any kind of popularity, it must be capable of operating on non-LOS paths and thus, I think that too ambitious transfer speeds should not be used.

The difference is that with packet radio, (the same) amateurs did both the development of new hardware and the deployment of the infrastructure.

In the telephone modem market, the development and manufacturing was done by commercial corporations, and both the users and the BBS sysops were buying these off the shelf.

Because of the higher volume, they were also paying less than what the typical higher-speed packet radio solution would cost (with the possible exception of 1200-to-4800 bps packet updates).

So, while the telephone BBS sysop was faced with costs and efforts, they were nowhere near the costs and efforts a typical packet radio node or BBS operator was facing. Same for the telephone BBS user vs. the packet radio system user.

Hate to shoot you down my dear friend but you obviously do not know what
you're talking about.. We're doing Packet right now and if not for the
licensing by the GERMANS we also could do Pactor I Pactor II also any other
mode.. that is out there so again I don't mean to be abrupt but if you post
information a little research would go a long way.. Best 73  and good luck..
Jim, WA2VOS

Hi Fellow Warblers MixW 2.0 RC6 now available for downloading.. The following Bugs were fixed.:
Bug fixes:
- RTTY 850 Hz shift must work now
- MT63 now allows not only 500 Hz start frequency
- DXCluster wrong mode selection bug is fixed
- ... and some more less important bugs are fixed including
  one registration-related.

The URL: is http://www.nbvv.net/~jaffejim/mixwpage.htm for those of you who do not know the modes that MixW 2.0 does here is a recapitulation of it's features:
Supports CAT, and Automatic antenna rotators, High Speed logging system, Contest Logging export both to ADIF files and Cibrillo files. Imports ADIF files from other logging systems. Does the following modes: PSK, QPSK, FSK31, MFSK,MT63,RTTY any speed any shift, CW, Packet HF/VHF, Amtor FEC, Pactor FEC, Pactor ARQ RX, Amtor ARQ RX, SSTV, Voice keying (calls cq or any other message in your own voice) FAX RX only displays Antenna Heading graphically and Numerically plus much more. Best 73 and Happy Warbling Jim, WA2VOS

Close Jim. Get rid of the apostrophe...

http://www.nvbb.net/~jaffejim/mixwpage.htm

Put that in a file for next time, so you don't have to
go through this every release.

73, Steve

My my sincere apologies I posted a URL with a incorrect address.. that is what I get for trying to rush things so early in the morning before my eye had a chance to settle down..
The Currect URL for access the MixW website is:
http://www.nvbb.net/~jaffejim/mixwpage.htm Please make note that I had reversed some of the lettering in the URL.. Best 73 and good luck.. again sorry for my mistakes.. Jim, WA2VOS

Hi Fellow Warblers MixW 2.0 RC6 now available for downloading.. The following Bugs were fixed.:
Bug fixes:
- RTTY 850 Hz shift must work now
- MT63 now allows not only 500 Hz start frequency
- DXCluster wrong mode selection bug is fixed
- ... and some more less important bugs are fixed including one registration-related.

The URL: is http://www.nvbbnet/~jaffejim/mixwpage.htm for those of you who do not know the modes that MixW 2.0 does here is a recapitulation of it's features:
Supports CAT, and Automatic antenna rotators, High Speed logging system, Contest Logging export both to ADIF files and Cibrillo files. Imports ADIF files from other logging systems. Does the following modes: PSK, QPSK, FSK31, MFSK,MT63,RTTY any speed any shift, CW, Packet HF/VHF, Amtor FEC, Pactor FEC, Pactor ARQ RX, Amtor ARQ RX, SSTV, Voice keying (calls cq or any other message in your own voice) FAX RX only displays Antenna Heading graphically and Numerically plus much more. Best 73 and Happy Warbling Jim, WA2VOS

Sometimes, when Ken and I are testing a new idea in SNOS,
we might load new software every 10 or 15 minutes for a couple
hours while debugging or trying out variations on the idea.
We use the internet to get the software updated of course (smile).

And that is one of the major problems with high speed packet,
particularly in places like this, where there are hills and mountains
everywhere, and almost never a good clean path.

> In order to be practically usable, the data transfer must work well in

Exactly. And the higher transmit power and higher gain antennas
make the cost of the links higher.

Stop using a monolith and use small loadable modules that can be demand-loaded into the OS kernel and/or your userspace application.

Then you won't need to transfer hundreds of kilobytes just to change a single function somewhere hidden inside it.

Rob

Dose anyone know of any software that will operaste at 300bps for hf packet on a sound card?? All the stuff I've seen so far is 1200 and 9600. Any ideas? de WO5M

Right, but as far as I know, there was no deployment of greater than 9,600 baud
in my area (Los Angeles, where we probably have 4% of the entire U.S. ham

population). It never caught on.

I don't dispute that an "economy of scale" didn't play a factor here.

However, once development is done and no longer a cost issue, I'm still surprised that the higher speeds never caught on. Look at the few "commercial" manufacturers such as AEA (now Timewave), MFJ, Kantronics, etc.... What are they designing and making still? 1200 and 9600 baud equipment. Nothing significantly faster (one of them has a 19.2, and I heard from Phil Anderson of Kantronics that a 38.4 TNC was planned some 4 years ago, but where is it?)....

The 9600 baud designs (by K9NG and G3RUH) were sold to the manufacturers, but as far as I know, the WA4DSY 56kB design has not been (but instead, makes its own line, which 6 years ago was very difficult to even find its site via the WWW).

I believe the KPC9612 does do 38.4kb. At least, according to the manual.

The WA4DSY 56kb modem was kitted by GRAPES and is now sold by PacComm.

Not many commercial manufacturers are prepared to take the risk of
introducing new packet equipment in a network that in many places
(including yours) did not make it beyond 1200 bps. When 9600 is too
much, what would happen with 38k4?

I don't know how far away from you he is, but one of the very active hams trying to introduce 9600 was WD6EHR.

Rob

Why not look at what's available from the folks who supply most of the high speed packet being done today? You can get finished and tested units, or kits, or just the download the specs and roll your own. Good stuff.

Mike, WD6EHR, is only about 15 miles from me, and he is one of the few "die-hards" who still has something on the air. I believe that he's given up on trying to push his ideas about a network, etc., because not more than just a handful (and I mean by that, 10 or less) of others even care any more.

East of Los Angeles, in the San Bernardino/Riverside area, I've heard that what was once there has practically been dismantled. Most stations are now off the air, and many mountaintop nodes have been turned off too.

The only thing that I hear on 2m is K6VE's BBS (the area hub), TRW's gateway, a couple of other BBS's, about 5 nodes, and some beacons from the RACES stations in San Diego. My heard list on 223.660 has not had a entry in 2 years. On 441.500, only one BBS shows up. I've even seen a complete, solar-powered packet station, a former netrom node (TNC, radio, outdoor casing, solar panels, etc.), for sale at one of our local radio swap meets about a year or two ago.

Speaking only as a "neighbour", I think we can say that the situation in Sweden is about the same as everywhere else in Europe.

The diversity in activities is high, even though there are fewer that do radio stuff on a regular basis. I get the impression that packet radio is more or less dying, at least if you compare to the level of activity 8-10 years ago. The interest in HF digital modes is constant or increasing, probably due to PSK31 and its cousins.

You'll find activity on bands from 137kHz up to plenty of GHz.

Hello friends,

what's happening with www.ampr.org. ??
It's been several days the site is down.

Cheers !
Thibaut / F5CDQ

Jim,

I DISAGREE!! It is VERY difficult to implement the BURST modes under Windows. The licensing issue is a SEPARATE issue. To my knowledge, there are NO licensing issues regarding AMTOR ARQ yet there are NO sound card programs for Windows (including MixW32) that implement it.

AMTOR ARQ requires VERY strict timing. (E.g. after receiving the ACK or NAK, the master must send the next data packet or resend the last within x ms. Even with Microsoft DirectX technology that would be impossible to implement under Windows. You would be lucky to get timing within 20 ms under MS DirectX.

Many sound card programs implement packet. But packet is NOT a synchronous mode and does NOT require strict timing.

Rob

Warren, KM6RZ is 150 miles and about 3 mountain ranges away and is one of the
other "die-hards."  He used to drive down for SCDCC meetings in Los Angeles
County, despite the distance.  Packet is almost completely dead in his area too.
N6IYA isn't even in Southern California, and therefore wasn't considered in my
response (he's between San Francisco and Monterey, and nearer to the latter).

In Felton ... I used to live two miles from John.
I forward with all three of them (k6ve, km6rz, n6iya).

While you might be able to use highly directional antennas in some nearly LOS, fixed point-to-point links and thus reduce the transmitter power requirement, this is not a general solution.

When you are well below LOS or when one of the stations are moving, there is not much point in concentrating the power to a narrow beam, since you do not know in advance, which path the strongest signal will take. The situation may change rapidly e.g. due to moving or parked cars reflecting the signal or more slowly due to absorption in changing vegetation.

You either have to use a high transmitter power and a more or less omnidirectional antenna or some very complex electronic realtime adaptive antenna pattern steering to concentrate the power to the best path for that moment.

While in free space, the received power density drops proportionally to the square of the distance, in non-LOS systems, the received power drops generally proportionally to the 3.5th or 4th power of the distance in an urban environment.

When a typical NBFM HT has a usable sensitivity of -120 dBm, the sensitivity figures quoted for Bluetooth and WLAN is in the order of -90 dBm, so we could expect a 1000 times transmitter power requirement when going from 9600 bit/s to some multimegabit system if the distance is kept the same.

On the other hand, if the transmitter power is constant, the LOS distance will drop to 1/30 for the high speed mode. In urban non-LOS paths, the distance might drop to 1/6, so if a 1 W HT on 23 cm is useful for 1.. 2 km, a high speed 1 W transmitter might be usable for 200 ... 300 m.

The large majority of practical ham paths would be non-LOS, so there is not much point in designing some high speed (1.. 10 Mbit/s) fragile systems for LOS paths, but instead design some medium speed (100 kbit/s) robust (such as OFDM with heavy FEC) systems for non-LOS paths.

All the links I'm interested in are point-to-point, and are LOS
or near LOS, so there is some hope (smile).

Yes - I have been chasing the same subject for some time. Try a programme called MixW, it is available for free download of a trial version. I can't remember the URL but a search or a look at the 'official' PSK site will point you in the right direction. Also look at other posts in this newsgroup.

Hi. Name is Steve and I just have my tech license right now and I am interested in PSK31. I notice there is alot of activity on 20m but until I get my general, I cannot participate. I was wondering if anybody does PSK31 on 6 meter and what frequencies do they use.

Thanks

Have you actually tried to use the network, in person?

I've spent a fair amount of time in the NYC/Downstate area (I'm from Upstate NY, myself), and, well armed with the northeastflexnet maps, tried hitting some of the stations. Nada, Zip, no luck at all. Unless the maps are wildly out of date, there certainly didn't seem to be anything there that could be hit with 5 watts and a 1/4 wave antenna from a stationary vehicle.

So, based on my *personal* experience, I'd have to agree with Hank. It seems dead as a doornail.

- Rich

You were likely listening to the 'non-amateur' TTY signal. I believe it is encrypted and using a wierd shift. So don't worry about it.

Like you I can't find much digital activity on 30mhz, wish more folks would get on the band. It is a decent band and needs used more.

Hi Steve!

There is indeed PSK31 on 6m. I use DigiPan
or HamScope, I set my rig for 50 MHz and the
program automatically shows the signals in the
proper freq range.

The Magic Band is called that for a reason....
The action is more sparse there in most modes;
but when you *do* find something, it can come
in from the most amazing places!

Good luck!

73,
Lisa AC7GE

I have heard a lot of non-ham rtty on 30M. This could well have been one.

Since you say it was wide shift, it probably was non-ham; 30M ham rtty follows the same seto of conventions as all the other bands.

Oddly enough, I seem to recall that Hank and I have had a number of USENET disagreements
over the years. :-)

Did you have anything meaningful to add, or are you just trying to change the subject and
prevent people from noticing that you're posting incorrect, and or/outdated information?

In the Boston area there are still a few of the flex nodes on air.

Mostly they don't connect much of anywhere, but you can hit
a few of them with 25W and a yagi from the northern suburbs.

May be a couple in the Berkshires still, and around Albany.

The northern links (via Vermont into Montreal) seem to be gone.

But Charles knows much more about this than people who have
been there and actually observed the situation.

Perhaps someone in the area will comment.

Which, of course, has nothing to do with the present discussion.
We might agree on some things, and disagree on others, but on
this topic we seem to have OBSERVED the same thing.

Hello to all,
    Thanks to everyone who reads this message. I have been out of
packet radio for several years. Recently we have been putting together
a series of packet stations for ARES usage. I tried to use my cmsg
command to auto transfer to the PBBS, as stated in the manual. It
works ok for a while, then just sends a "busy" disconnected message
when someone tries to connect to the main call. the PBBS can still be
reached with the call plus the ssid, but no direct connection or auto
transfer is possible. Now, this occurs at all times no matter which
way I have the cmsg command set to( eg. off, on). I can't receive
direct connection for keyboarding, once this occurs. After resets
(Hard and soft), it seems ok for a few hours . Then it goes to just
"busy" disconnected, even with cmsg off. I have tried everything I can
to correct. I have done hard resets, battery replacements, ect, with
no results. My conok is on. There is no bud list. Users and maxusers
is set properly. I am using firmware version 7.0. Now 3 of my friends
are having the same trouble with both Kam+s and Kpc3s. All of them
have different firmwares. It must be something simple, but its been a
long time for me out of packet. Any help you can provide would be
greatly appreciated. Thanks in Advance.  73s Frank WQ1O

Hi Fellow Warblers and other Digital users.. MixW 2.0 RC5 now with new features and Zoom in its' SSTV module has been posted on my website which is: http://www.nvbb.net/~jaffejim/downloads.htm. The following changes have been made to the program:
RC5:
- new DxCluster dialog
- SSTV ZOOM window
- New macros added:
   <MODE> prints current mode
   <KHZ:n> Frequency in kHz with n digits after decimal point
   <KHZ> the same as above with n = 0
   <MHZ:n> Frequency in MHz with n digits after decimal point
   <MHZ> the same as above with n = 1
- Some bugs fixed
- Expiration date is set to June 30.

For your information MixW 2.0 is the 2nd edition of our PSK oriented multi-mode software version 2.0 features:
PSK/QPSK/FSK31, RTTY any speed any shift High and Low tones, CW, MT63, MFSK, Hellschreiber, Throb, Fax RX only, Pactor FEC, Amtor FEC, SSTV now with Zoom plus other extras, Contest Logging, High Speed "Normal" Logging, Call book support, plus much more. Illustrated Help files both in English and Spanish.. Best 73 and good luck..Jim, WA2VOS

Gee, like it was any sweat off my ass if a LandLine Lid and a usenet Troll disagree with me.

I trust the word of the folks who actually build network over that of LandLine Lids of any description. I'm afraid that leaves you boys out in the cold. "Think" what you like. - Meanwhile, lots of Hams are having fun despite your piss-ant attempts at denial.

I used to think that Hank encouraged people who build network. Now I know better, and will not take his claims to do so seriously in the future. Might as well polish up your telephone connections, Hank. Crawl in and snuggle up with your LandLine Lid buddies, so you can more effectively denigrate the efforts of people who actually build network, as oppposed to whatever it is that you allegedly do.

;-)

Charles, N5PVL

So, just to clarify your response, what you're saying is:

"No, I haven't actually used the network that I've been promoting, and even though people can't actually find any nodes that still exist, and *NOBODY* has stepped forward to support my claim that the network is alive and well, I'm going to try some ad-hominim attacks, just to try to deflect attention away from the fact that I have no idea what I'm talking about, and that I've dug myself into a deep hole."

All I can say, Charles, is that you're trying to promote something, you REALLY need to get your facts straight, or you look like even more of a fool than you apparently are. It's admirable that you want to try to promote networking. Your skills at doing so, however, lead me to believe that you should let someone else do the talking.

If you can't do that, then I suggest you put your money where your mouth is. Provide me with a list of say, 20 nodes that I can hit along the Eastern & Southern corridors of NY, and the NYC area. If the maps on the web are in any way accurate, this should be trivial. When I'm down there at the end of the month, I'll see how many are actually in operation. I'll be happy to report on which ones are more than a figment of your imagination in this group.

Deal?

- Rich

Charles, you have confused someone else's comments with mine.
I always have, and continue, to promote ham radio. I've done
so since before you were born for heavens sake.

However, when anyone observes the exact same thing I have
observed, I *will* agree with them, no matter they are a Land Line
Lid, a CBer, or even (heaven forfend!) a Texan.

```

There seem to be only two kinds of TNCs (or other digital controllers)
available now: Some plug into the ISA bus, others hang off a serial port.

The ISA bus is dead meat. Serial ports only run at fairly high latency.

The cost of an ethernet interface has dropped to near zero.

Why no TNCs with ethernet interface?

Why would I like one?

With 100 base T or Gigabit ethernet, I get very low latency of communications between the controller and the host computer. I get a standard well-known and easy to implement interface. I get standard easily available cables.

What could that interface do for me?

The TNC could tell me "The channel has had no activity during the past 1 millisecond", "An AX.25 frame with destination xxxx is about to arrive", "The channel has just gone quiet", "The last queued frame was just transmitted", and many other fine grain details of the layer 1 and 2 activity. This would allow me to write generic "smart" drivers.

There is one thing required to make an interface like this useful:
a standard set of messages between the computer and the TNC.
Something manufacturers could include in their firmware.
Something that would replace "KISS" and "HOSTMODE" and
"6PACK" and the other protocols used for communication between
the host computer and the controller.

Maybe some organization might "step up to the plate" and design a prototype of such a controller. TAPR did this in the long distant past, perhaps they could do it again. (That was flame bait, for those who didn't figure it out (smile)).

Would there be enough demand for a new generation of controllers based on this concept? How many per month is "enough"?

Anyone want to do a business plan?

I am posting this for a friend who does not have a news feed.
His call is N0QXH and his name is Lars. He has 2) 75-100W
UHF MITREKS, with control heads and cables. They are in
very good condition and of course, operational. MITREKS
are easily modded for 9600 baud operation and articles
detailing the process abound. He is asking $75.00 each,
plus shipping. If you are interested contact him, not me. His
email address is: lahall@unique-software.com

Sounds good to me. One question, though. What types of modems should it support? Should it have a "modem disconnect header" to allow different flavors? Could it be done with DSP? I've never been involved with this type of hardware design, so please excuse me if some of my questions seem trivial.

> who didn't figure it out (smile)).

Those days are over. There are better ways to do small production
runs. I'm currently looking at a company in Phoenix that does runs
of 500, or even one (if you can stand the cost) :-) They use surface
mount techniques.

> Would there be enough demand for a new generation of controllers
> based on this concept? How many per month is "enough"?
>
> Anyone want to do a business plan?

I am guilty of procrastinating severely, but I did get some samples from
www.dvsinc.com of their AMBE 2020 chip, but need to get some
samples of the AMBE 2000 chip. The latter is Half-Duplex, while
the former is Full. These are voice compression (2.0 - 9.6 kbps
with FEC). What I planned to do was make a surface mount board
that allowed me to use a wire-wrap or other technique of interfacing

with other DIP type chips. But, that turned out to be a waste of money.

I have been working on a functional block diagram of a board that does both voice and data. In my case I'm not too concerned about lots of data, but things like alphanumeric pager messages, callsign, bearing and range via GPS coordinates (to the repeater or other users, etc). I would love to try 2400, 4800 baud as well as 9600.

I contacted an engineer who does surface mount designs, and after a month of legal documents and a 40 page checklist, I threw in the towel. He's good, but he's more of a lawyer than an engineer :-)
For every technical question he had a legal one...

I envision a black box with an Ethernet connection to the network, or a 3 volt TTL to an embedded processor (handheld). I'm thinking of using an APRS interface at the repeater, which would relay the GPS position of users, callsigns, and messages onto 144.390.
With a full duplex repeater, use of a FIFO can be done away with, as two of these Ethernet devices can be placed on the net (transmitter and receivers don't have to be co-located with the use of cable-modems or DSL).

Do you think any of those ideas mesh with your ideas?

Steve

I was thinking of 56k and T1 actually.
Nothing at all to do with applications, leave those to the host computer.
i.e. not an "application box" but a modem.
Hook whatever radio(s) and computer(s) you like to it.
Something as simple and cheap as possible, handling only layer 1.

My guess (and someone who knows can correct me here) is that the ethernet
interface itself should be in the $5 range, thus putting the majority of the
cost in the rest of the components (processor, memory, modem).

I like the idea of a modular box: different modems could be plugged in,
designed in, or enabled/disabled via manufacturing option.

Steve's comments in his post are to the point as well: what features
must it have to be marketable. My thoughts ran along the lines of
something simple, with all the upper level protocol and application
living on the host computer. I think Steve had in mind something more
stand-alone, with applications embeded. No reason one could not
design something that could be configured both ways (?).

Another option is a box that includes the radio, making it similar to a
wireless
hub, but without the protocol above layer 1 in the box.

Yet another option would be any of the existing TNC designs, but
with ethernet replacing the serial port. This design has the advantage
of being fairly conservative.

The thing I like about using ethernet as the interface is that I could
stick a batch of these things on a hub or switch, remote from the
host computer, perhaps up the tower where the antennas are located.

Hank Oredson wrote:

> Why no TNCs with ethernet interface?

It is a splendid idea, one with which I toyed several years ago. As a product, I don't think the general packet user community is interested in such a thing, though.

> Anyone want to do a business plan?

The cynic in me asks "how much can you afford to lose?" before figuring out if even one could be sold as a product. I suspect you could sell 1000 of 'em in maybe a year; suppose it only costs $50,000 to design and bring to manufacture one of these (which means a lot of stuff is done for free by the designers), this is still $50 of NRE to recover in each unit. On top of that, I suspect the retail price of the TNC would be this *plus* the cost of a current comparable TNC at the minimum, probably more like $400+ each.

In other words, I don't think this is feasible in a conventional way.

On the other hand, something like an Enbedded PC with integral Ether and Sound plus a Compact Flash boot disk might be just the ticket for an embedded Linux + soundcard AX.25 implementation. The only NRE is software. Embedded PCs aren't exactly cheap but I doubt they're any more expensive than a custom purpose-built TNC. An Advantech PCM-5820 with audio retails for about $400; add $60 for a Compact Flash boot device and $20 for a box and odds-n-ends and you're not that much more than I suspect you could retail a custom Ether TNC for.

Keep in mind that such a Linux-based solution could likely do a lot more than the custom TNC solution and would leverage existing development tools and experience.

At typical ham RF speeds up to 56k the standard PC serial interface at 115200 bit/s, the latency is not a big problem with suitable protocols. You should be able to get information within a millisecond when the channel becomes free or busy.

>The cost of an ethernet interface has dropped to near zero.

>Why no TNCs with ethernet interface?

Using bare bone promiscuous mode ethernet is problematic, since all operating systems do not support it and in most cases you would need a separate ethernet card in the PC for this connection.

UDP is not much more complex than promiscuous mode ethernet and most operating systems support it on the standard interface card.

A TCP/IP stack is very complicated, requiring a lot of buffer space and are thus hard to implement on a small micro controller in a TNC or similar external modem. While there have been stories about web servers on a PIC, these are heavily stripped down versions of the protocol specification. If you attempt to use TCP/IP for realtime, it fails very easily due to unpredictable propagation delays e.g. due to retransmissions. In a typical realtime system, there is a lot of data that becomes useless, if it does not arrive on time, thus, there is no point of retransmitting it.

Thus, I think that running UDP over ethernet would be the best alternative for such a connection between a TNC (or whatever it would be called) and a PC.

> "An AX.25 frame with destination xxxx is about to arrive",

You don't know that until you have checked the CRC. Doing any decisions (other than this is addressed to me) based on the address in header without checking for corrupted addresses is very dangerous.

Several years ago, at least 5 I think, a small group here (involved in the PA0HZP OptoPcScc card as well) did a design like this:

- Motorola 68EN360
- Boot prom
- DRAM SIMM
- 3 "high speed modem disconnect headers" (German DF9IC standard), would each run at megabit speeds in fullduplex
- ethernet interface

It was intended to be the successor of the SCC card. It would run as a router connected to a PC or Mac (running some downloaded copy of NOS, for example), or it could be used in a node. When more than 3 radio ports are required, just put more of them on an ethernet LAN. On a node/BBS, the BBS would run on a PC also on the LAN.

Looked very neat. Schematics were drawn (very simple with this chip), and I even talked a little with a manufacturer. I studied the 68EN360 databook and prepared to write the drivers.

Problem: it would be more expensive than a TNC or SCC card. We already found that many hams were hesitating to buy an SCC card, which we were then selling at about $80 in kit form. Home users wanted something as simple as a Baycom modem and were not interested in speeds upwards of 1200 bps.

We would have to design a 4- or 6-layer PCB and would have to run a batch of about 100 boards to be anything near cost-effective. It would be very difficult to get these boards sold, as there is only a relatively small group of people interested in high-performance packet.

What killed it at that time, was that several people were starting to undercut the SCC card project by just copying the design and selling slightly cheaper. The local packet radio society, PWGN, favored selling these clones over the original product. So PA0HZP, who personally took the risk to order PCBs in batches of 100 and later 200 pieces, was left with many unsold boards. It seemed to be unwise to start another project, risking that it would end up the same way. After all this was not setup as a profitable business, but was all done as a hobby and by volunteers.

So the project just died there. I have read sometime about a German project around the same chip and with similar design goals, it may be that they got a working product at the end.

I think you should not attempt to implement a KISS TNC anymore, not on
ethernet and not on ASYNC.

When an external unit, connected to ethernet, is to run packet radio, it should function as an IP router. When you want to run bare AX.25 connections, it should implement a stream protocol over the ethernet to feed data from/to an AX.25 engine running on the external unit.

So:

PC <-- IP over ethernet --> black box -> IP over AX.25

PC <-- TCP/IP over ethernet --> black box -> AX.25 connection

And possibly:

PC <-- UDP/IP over ethernet --> black box -> AX.25 UI frames (e.g. APRS)

The channel access should be done by the external box in any case. The PC should not be (timing-wise) involved in the decision to key the transmitter. Then there are no realtime problems, and you don't see the terrible on-air performance so wellknown from KISS-based systems.

Of course you will need some software in the external box. It is complicated, yes, but it can mostly be built from existing open-source stuff. It could run an embedded Linux, or a version of NOS. You would "only" need to write the drivers, and those would be needed anyway.

The single-chip controllers that do have the required ethernet interface and one or more fast HDLC-capable interfaces already do have a CPU powerful enough to run such software. You would not use a PIC for this box. 5 years ago, when we looked at this, the 68EN360 or 68EN320 looked promising. Undoubtedly, other controllers have been released in the meantime.
(Motorola also released a controller with both a 68K CPU and a 56K DSP on a single chip at that time)

We recently obtained a few (PC-104) embedded PC's for a FlexNet project. For about 250 bux each, we got 386-33's with 1 MB RAM, 1 MB Flash card. 5"x5" in size, no moving parts. The development kit, which included one embedded PC along with all the goodies needed to set the little things up cost around $425.00.. These units run on 5 volts. We have found it possible to power the PC-104's from the radios we are using, which have 5vdc available in a plug intended for some kind of accessory we do not have.

The dev kit comes with a terminal program. Run a serial link to the PC-104 and the terminal program gives you the mini-PC's C:\ prompt. No need for a video card or monitor, just use a regular PC or laptop to set it up, then jerk the serial cord and it stands alone.

We are looking into the possibility of putting the computer inside the case of a (working) MFJ 1270c, adding an additional 9-pin serial connector to the back for terminal access to the mini-PC, using the TNC's 9-pin serial connector to connect two other 1270c's a'la 6-Pack.

Digressing for a moment back to the actual thread here; I remember this same discussion quite a while back, on one of the TAPR reflectors. Much of it was word-for-word, what has been said here. It was a great idea then, and it's a great idea now. One thing I have trouble understanding is why it would have to be so expensive (making a decent run of them, of course, instead of just a few dozen.)

Ok for 56k, not ok for T1 or faster.

Use connected mode ethernet.

Yes.

Memory is cheap. But I see no point in having tcp/ip in the
controller. Ethernet should be sufficient.

> Thus, I think that running UDP over ethernet would be the best
> alternative for such a connection between a TNC (or whatever it would

Perhaps I'm being stupid this morning, but I do not see the need
for anything other than ethernet as the protocol.

> > "An AX.25 frame with destination xxxx is about to arrive",

> decisions (other than this is addressed to me) based on the address in
> header without checking for corrupted addresses is very dangerous.

Um ... you don't know a CORRECT or COMPLETE frame has
arrived until it has all arrived, but once you have the destination
address, you can begin to set up the response buffer, etc. etc.
so everything is ready to go once the checksum is verified.

The equivalent of speculative execution: you might have to toss
something back into the buffer pool when the checksum fails,
but if it does not fail, which will be the usual case, you lower
the latency of the response. You can also adjust the delayed
ack timer and do other interesting timing calculations.

Maybe that is over-aggresive. But I would like to be able to
experiment with the ideas before rejecting them.

The simple act of encapsulating the frames in UDP buys a level of independence from the physical network at virtually no cost. Host software built on top of UDP would likely not need to change if the physical network were to change; also, API support for UDP is probably better than 'raw' Ethernet in most OSes and libraries.

Yes.

From most of the responses, I think my description of what I want to be able to do was not very clear. Will try again with some different examples and maybe that will help.

I want to be able to connect one of these devices to the ethernet switch that sits near the ham radio equipment, or into the hub that sits over in the other room, or into the mini-hub upstairs. Then I want any host on my network to be able to access it.

Some hosts may run tcp/ip over the radio, others may run ax.25 or flexnet. May want to run clover or pactor-II or psk31. I do not want those protocols built into the controller, any more than I want tcp/ip built into my ethernet card.

i.e. I want a more-or-less generalized MAC (Media Access Controller) that gives the hosts access to RF via whatever radio(s) are attached to the device. This implies DSP in the device eventually, and some ability to upload soft modems to it. Did not envision anything beyond layer 1 in the device, because I want the layer 2 and above protocol in the individual hosts that make use of the radio(s) attached to the device.

For an initial prototype something like the DSY modem with ethernet would be just fine ... there is little to invent.

I've not done a search for chips with cpu/ethernet/scc (for example) but if one does not exist it should be simple to create from standard cells/macros/whatever in a custom chip. One could always prototype with several chips if needed.

As has been pointed out, doing much of anything interesting will take at least $50k up front, and I suspect at least twice this amount, since there will be some software involved.

How to make a viable business? The experience of many existing companies hints that there must be commercial application before it is worth even doing a business plan. Has to be a market for at least several tens of thousands of devices?

Hi, I'm thinking about building my own stripped down PSK31 modulator + demodulator and have zero experience with it. How much of the time is the QPSK mode used? If you only have the BPSK mode without the convolutional encoding and Viterbi decoding, can you still make halfway decent QSOs? How about with QRP? Thanks for any help,

OK, but if you're going to do that, then why are you suggesting all this "low level crap" such as the interface reporting back to the compute, "I've been idle for xxx milliseconds?" That DEFEATS the purpose of the first part of your suggestion. Furthermore, this will limit the device to only being able to interact with its ONE controlling host (also implying that no other device may share that ethernet).

What is MORE reasonable, and what the REAL WORLD does, is to have an interface that appears to just be another host on the ethernet. Almost all bridges, routers, stand-alone firewalls, and ethernet-to-T1/E1/DSL converters work that way. So do ethernet modems and ethernet printer interfaces. Using this as a model, we simply have a standard ethernet host interface, and the level 3 or higher protocol (be it TCP/IP, NetBEUI, MS networking, or whatever) will have the responsibility of negotiating retransmit conditions, etc. All low level considerations are taken care of by the "virtual host" that makes up the interface. With this, all the hosts on the network can share the ethernet-TNC.

If you don't want any protocol built into your ethernet-TNC, then you're going to want something similar to what Multi-Tech produced in their "ethernet modem" series. Their devices are embedded 386/486 systems with PROMS designed to ask the network for its controlling software. For TCP/IP, it would ask via the BOOTP protocol; for Novell Netware, its protocol, etc... Even if it uses what Hank dreads - TCP/IP, once the software is moved over, it need not ever use it again during operation. One can put whatever one wants in there.

I have one of their devices and I actually, via BOOTP, place a minimal Linux kernel in there. Although I don't currently use the second serial port (9-pin interface, and the first port is the built in landline modem), I could easily plug any RS-232-C device, including a TNC, there and effectively create and use it as an ethernet-TNC that you proposed (up to 56k). This hardware is 10 years old, and is pretty close to what you want (although not exact).

In your target configuration, you would load software that takes your TNC's packets and routes them onto your ethernet via the ethernet-BPQ protocol (which will effectively be AX.25 over ethernet) and let your other host computers decide what it is.

Why tell you about this? This means that for up to 56kB, equipment (or a combination of equipment) already exists to do what you want, and certainly that would be a good logical step in development to creating your 1MB-range wireless TNC. Conversely, swap out the existing landline-type modem and replace it with your wireless DSP. Maybe even Multi-Tech or a competitor will design a suitable

DSP for you. (For the M-T line, the internal modem is on a daughtercard.)

From what I've seen, 90% of the people out these don't even seem to known about QPSK. I run QRP, exclusively, and so therefore copy can get rough on the other operators, at times. I would then suggest to go to QPSK, and almost invariably the op would have no idea what I was talking about, or why we might want to try it.

So, for the way people seem to use PSK now, a system lacking QPSK wouldn't be terribly crippling.

What platform? Which OS? Why?

"Building" suggests that you want a hardware implementation,
which is a mistake (especially with "zero experience"). PSK31
was designed to be generated and detected with software.
Which I know scares the crap out of lots of hams.

> How much of the time is the QPSK mode used?

Almost never. A neat idea, but it just never caught on.

> If you only have the BPSK mode without the convolutional encoding
> and Viterbi decoding, can you still make halfway decent QSOs?

Yes. Convolutional encoding is only used in QPSK mode (RTFM).
Viterbi decoding isn't required for decoding - there are lots
of other algorithms to decode convolutional codes.

> How about with QRP?

PSK31 works extremely well with low power. If you had
actually used it (your questions suggest not), you would
know this.

Guess I miss your point. The host/device protocol would certainly
allow multiple hosts to access the device, at the same time, and use
the same radio(s).

They can all share it using any number of different protocols, as you mention.
But that is not what I'm interested in doing.

I think a hardware/firmware "QRP" implementation would be an excellent idea. PSK31 works great with QRP *but* the computer draws more current and represents a greater physical size than the whole rest of the rig. A direct hardware implementation could:
1) be designed for low power consumption - battery operation.
2) directly modulate the RF rather than using SSB and audio tones with the possibility of overdriving, hum, and distortion.
3) be small size and include a small, low power LCD display - no hard drive or storage, just keyboard to keyboard real-time QSOs.
4) be a "one box" solution containing everything needed to run PSK31.

```

the following page describes a design for a PIC based psk31 implementation. The following is an excerpt
(Note that I have NO affiliation with the author...this just came up on another forum a while ago)

"Abstract:

These pages describe a means whereby a PIC16x84 processor may be used to generate a PSK31 or FSK31 signal. This could be used for beacon transmissions (as described here) or they may be used for telemetry, experimental, or even QSOs - the latter being true if you are willing to put up with a few "quirks":-)

Why tie up an entire computer/radio to set up a PSK/FSK MedFER/LowFER beacon?

This is the question that I asked myself. While my HF rig is capable operating in the MedFER frequency range, it seemed foolish to tie it up in this fashion, and it would tie up an entire computer/sound card/ect. Having operated beacons in the past, I feel that the lower the "hassle factor" involved in operating the beacon, the more likely it is that you will keep it on the air - and that is the entire purpose of even attempting to operate a beacon.

When I decided to put a PSK31 MedFER beacon on the air this time around, I

decided to follow my previously-established philosophy: I wanted a
beacon that could send a message in PSK31, and just work when plugged in.
To generate the PSK31 data, I decided to utilize the now-ubiquitous
PIC processor and incorporate it with other fairly simple circuitry. "

Computers already can run a tcp/ip stack over ethernet, or those folks using
them with cable modems and DSL modems couldn't do so.

Hank, I don't know the answer to your question, but may I suggest that until a new killer digital mode comes along that lots of hams want, the present generation of controllers will remain King & Queen, and assorted court members. May I also suggest that if you're just controlling things, that you might also

want to look into USB ports, even though they're slower than good Ethernet 100 cards. Even some of the DSL & Cable companies are providing USB controllers.

My point is that a host-to-device protocol is usually ONE-TO-ONE and what you
need is a host-to-host type protocol (virtual host OK). Anything of a "lower
network level" than that eliminates the possibility of use by multiple hosts.

> > What is MORE reasonable, and what the REAL WORLD does, is to have an

"usually" ???
Not in my experience, at least for some values of "usually".
Don't want "host to host" protocol, don't want the device to be a host.
Just a device.

But this has wandered very far from the original idea.

ACARS Log Analyser for Windows is now available for download from
http://www.acarsonline.co.uk/

This program will allow you to import ACARS message logs and view/print them
in a variety of ways and provide statistics for your logs.

Cheers,

Mark Avey

This is only the transmit side. Generating PSK31 is easy.

Detecting it is not. How did you propose to do so?

It's lots easier to generate signals than it is to
detect them.

Even in networking environments, "shared devices" are primarily controlled by the host they're physically connected to - so there's the context of "usually."

I'm not fully certain I know what your original idea was....

You seem to want some sort of high speed computer to radio interface (greater than 56kb, and speed of 1Mbit/s or better desired on the wireless side), where the computer interface is fast and common (ethernet proposed), and that the device be shared by multiple computers, yet certain "low level functions" of the device be available to each computer. For radio reception, the device simply routes the received information to the appropriate computer (if more than one).

Is that part correct?

I can't make a comparison - don't have a TS-2000 or TS-870S. The PRO is super on digital modes. For PSK31 I set the bandwidth to 100 Hz and the tuning rate to 1Hz then tune the signals on the PRO. It eliminates most of the AGC pumping problems seen by having a bunch of signals in the IF passband.

Not much. Ground waves decrease at night and would probably get better reception 50-100 miles further out.

All,

Want to get into packet & APRS and am considering either the MFJ 1270 or Kantronics KPC3+. Although the 1270 is cheaper (in cost), lots of MFJ products get mixed reviews. So, I'm looking for opinions. If you use either (or both) I'd be interested in your opinions/comments.

73,

Brian

A lot depends on what you want to do with the tnc. I have used many many

1270b's in a netrom network. you can pull the factory eprom and insert a jkiss eprom for bbs work, a uidigi eprom for aprs digipeating, and another eprom for who knows what other application. Kantronics boxes tend to have very unique software/firmware, making that not as easy. MFJ's are basically the old TAPR2 tnc with a few modifications. Kantronics are their own design. You pays your money and you takes your choice. I saw 1270's at Dayton for $30 apiece.

I apologize in advance for continuing a discussion that should more appropriately be in the rec.radio.amateur.antenna group, but it's an interesting question and it wasn't posted over there.

Martin Volz is absolutely right, and it can be frustrating. I work in Washington, D.C., live in Baltimore, and frequnetly listen to WBAL, a 50 thousand watt station that is heard throughout the Baltimore-Washington area and beyond during the day, and is heard all up and down the east coast at night. All up and down the east coast EXCEPT for an area that includes from about 10 miles north of Washington to somewhat south of it, where ionospheric waves pick up, that is. So if it's dark when I leave the office, I can't listen to it for the first part of the commute.

I would assume that this phenomenon exits because the antennas of almost all commercial AM stations are verticals that have pretty much of a null in the vertical direction, so that they don't operate as "cloud warmers." I've often wondered about why more AM stations don't use an auxiliary horizontally polarized antenna that is pretty low, and that could permit them to cover the area between the reach of their ground waves and the beginning of the ionispheric waves from their vertical antenna at night. I've got a ladderline-fed doublet that is about 30 feet off the ground in some trees, and while it's not much of a DX antenna on 160 meters (although I have worked the west coast and Caribbean on 160 meters using 100 watts), it works real well as a "cloud warmer" up to a few hundred miles out with no gaps in coverage that I've ever been able to discover. (For those who aren't hams, the 160 meter band is an amateur band just above the AM broadcast band.) It would seem that for a relatively minimal investment in equipment, commercial AM stations could insure coverage at night of their entire daytime listening area. Does anyone know why this isn't a standard approach?

Anyone out there using AX25 with Linux 2.2 Kernels?

I am trying to configure AX25 and running into all kinds of problems.

Documentation seems to be virtually non-existent..

I was told to use   ax25-config   but it does nothing. It asks me
a bunch of questions then quietly goes away without doing a thing.

I tried creating minimal configuration files based on the man pages
and what I did before with 2.0.33 Kernel.. and the interface comes up
then about 30 seconds later quietly goes away with no indication as to
why.   Is this stuff supposed to work?

I am running Slackware 7.2 with 2.2.19 Kernel. Using KISS TNC.

Pete Rossi - WA3NNA

It's not worth the trouble, Pete. Once you finally get it going, what you will then have will be the latest technology in packet radio - from 1985 or so. OK for nostalgia buffs, but a poor choice for serious use. The old stuff with the KISS protocol is slow and dumb, compared to modern packet software.

Packet has come a long way since the 1980's, and the new growth occuring in the US packet network is all the new stuff. Running Linuzx's AX25 implementation with a KISS TNC will just mark you as an "old duffer", unwilling or unable to keep up with the times. They will be able to tell you are running obsolete stuff, just by watching your stations' behavior on the air. Once you've seen the difference, it's pretty hard to miss. The new stuff really goes; the old stuff blows.

I assume you are wanting to run the IP applications included with Linux over packet. That's a good reason to work with Linux, and a lot of hams use Linux for that very purpose. For IP apps, I don't think you could find a setup that would really be any better. (I'll probably get some arguement about this from Windows enthusiasts.)

Instead of tinkering with the Linux AX25 deal, just set up a set up a high-speed serial or preferably ethernet connection between your Linux box and an old 386 or 486. You can get these old computers for free, or for next to nothing. Install DOS on the second machine.

In the DOS box, set up and install FlexNet. Here's where you can find all the info you need, including a link to the FlexNet website so you can download the software.

http://www.the-i.net/~n5pvl/flexnet

The way it works is to let the DOS box with Flexet handle all of your radios, with a high speed link to your Linux box, where the applications reside. This is generally acknowleged as the best setup for Amateur tcpip, used by thousands of hams in Europe and the US. The reason so many hams go to the trouble of setting up a DOS box for FlexNet is that it gives you significantly better performance on the air. The old KISS stuff will only slow you down.

If you are not interested in tcpip, the link to the Linux box would not be neccessary. Just use the DOS box running FlexNet.

You will discover that FlexNet in DOS shares one quality with Linux - It runs forever.

Depending upon the FCC imposed license restrictions, in the evening some radio stations are required to modify their patterns to protect others due to the skip.

The radiating patterns from what I can remember in general are deterimned by the FCC Rules and Regs. Been along time since I worked in braodcasting but that is what I remember.

In my view, the KPC-3 and KPC-3 plus are better TNC's for APRS.  The
KANTRONICS firmware have lots of great features for APRS such as a
UI-digipeater for APRS applications.  Most other TNC's do NOT have enhanced
commands for APRS.

We had a couple of guys try PSK31 on VHF, but it was not as useful as packet
so they decided to save PSK31 for HF. Just about everyone does, as far I
have been able to tell.

Are there large numbers of hams in your area using PSK31 on VHF/UHF bands?

Why?

Large?  No.  About the same number as FM packet.  Try listening around
144.2 USB and see if there are PSK31 users on sideband in your part of
the country.

None right now, but then again, 3/4ths of our ham polulation is currently in the northern US, the "winter Texans" who brighten up our fall and winter here at the southern tip of Texas, then migrate north during the warm weather to travel or visit relations.

To be fair, I'd have to check again next fall. Right now all ham activity in the Rio Grande Valley is at it's lowest ebb of the year.

I have personal doubts about psk31 on sideband giving packet any serious competition on the VHF/UHF bands. I'm sure it's fun, but it's not the kind of deal that is likely to be done by "Joe Ham", like packet. I've worked sideband on 2m a few times, trying for DX. The counties down here are all rare. When I visit my father in Willacy county, the ham population there doubles, so just about anybody is glad to QSO. Some guys get really excited.

- But ssb rigs and additional yagis on the flat side is more expense and trouble than I think we can reasonably expect large numbers of hams to go for. The packet stuff does more on the VHF/UHF bands. It's faster, easier, cheaper, and there are more servers available. Packet is still great for keyboard QSO's, (most of the activity here) but you can also access the file server, cluster, or PMS. (We do not have a "full service", autoforwarding BBS here.)

We've been looking at the "Ham-Web" multicaster too, which can move incredible amounts of information in a very short time by eliminating almost all packet overhead and delay. It basically streams the data without acks (one way) in extremely long packets, and when it's sent what it has, it goes back to the start of the file list and does it all over again. The multicast transmitter must be able to handle what amounts to continuous duty.

The client software automatically updates files and messages it did not recieve in full the first or second time around, as it recieves them again. It ignores stuff it already has. You can send 500 packet messages and bulletins in less than a couple of hours, and throw in html pages, local info such as VE testing schedules, repeater freqs, club meetings, weather forecasts, you name it. - And still end up resending it quite a number of times per day. To recieve it, any FM 2-meter reciever, including a scanner will do. No need to transmit, as the server does all that.

I can most certainly see where psk31 on VHF/UHF would be fun. After all, before there was packet, there was VHF RTTY BBS's. The first BBS in the valley was VHF RTTY. But I do not think it is realistic to compare it with packet. To suggest that it will "take over" from packet in a general sense is just plain silly, even though it may have become popular in your neck of the woods.

The Kantronics gear is better if all you ever plan to do is APRS.

If you are interested in other facets of packet, the MFJ is the clear choice since it's firmware is open-code, making the MFJ capable of things the Kantronics gear can never do on account of it's proprietary nature. Lots of software will work with the MFJ TNC2 clone that will not work with Kantronics gear, including the new FlexNet software that is currently revolutionizing packet.

Some hams use MFJ's here for APRS, and I have not heard any of them complain. I've used a borrowed MFJ 1270c here once for APRS, and I didn't notice any problems in those few days. It cranked right along.

But if you are sure that APRS is all you'll ever want to do with that TNC,
the Kantronics gear has a slight edge.

I haven't been to all of the US like you apparently have, so I can only speak
for the greater metropolitan California area: any packet other than APRS is

in *severe* decline.

APRS is almost exclusively 1200 baud, just like in the 1980s.

************ ICOM IC-22A �30 **

Icom IC-22A 2m 10w FM transceiver, with tone burst, microphone, mobile
mounting bracket, power cable and manual (including schematic diagram).

22 crystalled channels:

1	R1	12	S12 (RTTY)
2	R2	13	144.560
3	R3	14	144.625
4	R4	15	144.650

5	R5	16	144.675
6	R6	17	S17
7	R7	18	144.800 (UIview/APRS)
8	Reverse R6 (RX only)	19	S23
9	Reverse R0	20	S20
10	R0	21	S21
11	S11	22	S22

(plus a spare satellite RX crystal, 145.???).

The case is a little worn, but the radio is in good working order. Can demonstrate on-air.

***** Ideal for packet digi / UIview / APRS.

Mid Bedfordshire (1.5 miles from M1 junction 12).

Will deliver up to 20 miles.

I'm sure you are aware that the big holdback in California packet is social
and political, not technical or financial..

Here's where most (but not all) of the real action currently is:

http://www.northeastflexnet.org/

On their network maps, the FlexNet nodes shown were all set up in the last
couple of years. Somewhere near eighty (80) of them.

They have experienced so much growth, so fast, that the network maps you
will see only reflect about 2/3 of what currently exists. They've been too
busy building network to keep the graphics completely up to date.

There are other groups around the country doing the same thing, but this is
the BEST example of hams in the US discovering that the new stuff works so
well that it has revitalized packet in an area that started off with three
nodes in NY, but which now covers several states.

PC-FlexNet allows you to run other software on top of it. In their node
computers, they also run either a Cluster, IP router, or BBS, depending on
which is needed most at a particular node site.\

Aparrently, the hams in that part of the country have been enjoying FlexNet
much more than the disintegrating X1J net that preceded it. So much so, in
fact, that their network is growing at levels comparable to what we all saw
back in the 1980's.

No, but I'm trying to get back into ax25 here (Slackware-derived,
kernel-2.4.4, egcs-2.91.66). It's not much fun...

>I get a series of errors; for example, in compiling ax25-apps, I get

For me the apps stuff compiles, not the tools.

```
>call.c:467: storage size of `ft' isn't known
>call.c:495: warning: implicit declaration of function `mktime'
>call.c:467: warning: unused variable `ft'
>make[2]: *** [call.o] Error 1
>make[2]: Leaving directory `/Radio/ax25-apps-0.0.4/call'
>make[1]: *** [all-recursive] Error 1
>make[1]: Leaving directory `/Radio/ax25-apps-0.0.4'
>make: *** [all-recursive-am] Error 2
```

I'd recommend subscribing to the linux-hams list - send mail to
majordomo@vger.kernel.org with "subscribe linux-hams" in the body of the

message and follow the instructions in the response.

There may be one or two other ax25 people on the fringes of uk.comp.os.linux but it's a fairly specialist subject. Not sure how much Linux input there is in rec.radio.amateur.digital.misc these days: not a group I follow.

From the mailing list I see a comment from the maintainer that it's a libc problem and the workround is to have:

```
#include <time.h>
AND
#include <sys/time/h>
```

defined in EACH place where it complains. I haven't yet fixed the sources here, but I'll report back later today. Probably.

Dan

All the ax25 gurus seem to be on the linux-hams mailing list.
I can't remember how to subscribe. Try sending a message to:
majordomo(AT)vger.kernel.org with: subscribe linux-hams
in the message body.

HTH.

Which version of ax25-config? Are you root user? Does it create
/etc/ax25/ax25-up or /etc/ax25/ax25-config.conf?

If it doesn't work at all, did you consider writing a bug report?
(I don't remember getting one)

Anyone have any success or or suggestions about the method and equipment used to recover spread spectrum cordless telephone transmissions? They are in the 902 to 927 mHz range. Thanks for answering here, so that all may benefit.

>No wonder the network out here is in the toilet.

Well, in general it can be seen that the DX Packet Cluster operators and their users (even the writers of the original software) are in the "I don't care as long as I get my thing" category. They are only interested in spreading DX spots, and ultimately in working the DX station. They aren't interested in the best cooperation with fellow amateurs to achieve the most efficient use of available resources, just because their hobby is about competition, not about cooperation.

I would not critisize them too much for it; it is their nature, it is why they went into DX'ing in the first place. The group that is DX'ing is totally different from the group that unites to build a working packet network.

Maybe the only way to get them away from there is to send DX spots to their cluster at the time the Shuttle can be worked in the area, maybe in automated fashion. In the short term it may ruin your own qso, but in the longer run maybe their own user group will start asking for a different frequency?

(of course this won't work when it is an HF group)

Rob

You're not supposed to be able to decode spread spectrum. It is a secure mode!

Hi,

I have a Tiny II TNC which I recently activated the KISS mode on via the "KISS ON/RESTART" commands. But now I want to get it out of KISS mode and I can't figure out how to. The manual says that to return to normal firmware mode you should turn the TNC on and off, I've turned it off at least 3 times, both for a few seconds, a few minutes, and several hours, with no success.

I guess the only thing left to do is remove the battery jumper and hope that parameters return to factory default. However I don't want to fully reset the TNC if there's a better way to get it out of KISS mode, especially considering I'd like to be able to switch between KISS/firmware as I move in and out of the shack during the day.

I normally work the TNC under Linux, using LinPac, however I can switch to Windows/DOS if necessary. Any ideas?

I worked on RF hardware and software design of spread spectrum phones. The US government would have a serverly hard time decoding a spread spectrum signal phone (its easier to just tap the line...hehehe). The base unit passes the handset a "seed" this seed corresponds to a psuedo-random high speed code on which the multichipped audio stream is EX-OR'ed with. Also there are control signals passed back and forth between base and handset....not to mention channel selection...etc. Sounds complicated yet?.....well there is more.....Your receiver archetecture only takes care of the physical radio demodulation......there is the software layer that is the BIG unknown, that layer takes care of EVERYTHING, if you have no clue how or what it does you will be spinning your wheels for years.

Best Regards,
MacGmaN

Removing the battery for a few minutes will restore the defaults,
simply removing power will not, as you have observed.

You can turn off KISS mode by sending the following hexadecimal
sequence to the TNC:

C0 FF C0

I'm not familiar with LinPac, so I don't know if it supports doing
this. With the various flavors of *NOS, you can send the command
'param <iface> 255' to exit KISS mode. Alternatively, you could write
a script to send the hex characters to /dev/ttyS1, etc.

Try sending it the following character sequence: C0 FF C0  (hex)
This could be possible from DOS programs using Alt-192 Alt-255 Alt-192.

I don't know if this works for your particular TNC but it is a de-facto
standard command for ending KISS mode.

I just checked the LinPac docs and noticed that it uses kernel AX.25,
in which case there is an easier way to do this:

```
kissparms -p <port> -x
```

The kissparms command is part of ax25-tools (see
http://radio.linux.org.au or http://prdownloads.sourceforge.net/ax25).

The way I finally got rid of KISS mode was to remove the EPROM chip, erase
it, and install trhe 6-Pack driver image used with FlexNet. It works much
better now, and I am never bothered by KISS.

You'll need a DOS or Windows computer to really benefit from 6-Pack/FlexNet,
but it is well worth the trouble.

I certainly don't have anything against the Packet Cluster ops in general. It's just this particular one has been asked repeatedly by myself and others if he knew he was on a frequency set aside for space use. At first he replied "Gee...thanks for the info. What do you suggest I do?", and after being politely asked if he could move, the replies stopped. And I also don't want to start a usenet war about "Nobody owns a frequency, and I'll damn well transmit where I want to". There's enough of that mentality already. I KNOW it's hard to find an open freq in Southern California, but to just take over a frequency that's been "Reserved" (I don't know a better term to use) in the published band plans is just poor practice IMO. Our ARRL Division Director tells us to just "Talk it up and spread the word around and maybe he'll move", and the ARISS people have been strangely silent. NOBODY wants to do anything "Official" to request/tell/force the sysop to change frequencies, which I also find strange, as he already has another cluster on an "Officially Sanctioned" cluster frequency. Does he really need to run two? With all the whining going on about "We Need To Attract More Young People", it's embarassing to try and explain to "The Young Poeple" why we can't have a voice QSO with the International Space Station because some Bozo decided

```
he wanted to run a DX Packet Cluster on the channel.
I'd better stop now before I go into my rant mode.
Thanks for the reply, Rob.
Jim

And a few of them are still on air.
But they are basically unused.
(From phone call with someone involved in that project.)

If you are using SNOS, you just type .k (dot and lower case 'k')
and the TNC will be put back in normal command mode.

Well, my prejudice about DX cluster operators stems from a couple of
similar incidents (often not as much about the operating frequency)
and the general lack of interest in development of more efficient
ways of distributing multicast information that the original developers
and the majority of the userbase have shown in the past.
("we only care about the fast reliable transfer of DX information using a
standard TNC connected to a dumb terminal". that would rule out any
attempts to use UI multicasting with some special program to process the
data at the user end, ask for retransmission of missed packets, etc)

Probably there are many nice operators, and I think the software developers
that have developed clone software also have a more reasonable approach.

Rob

Sorry, Hank; You have been fed a load of farina, most probably by a disgruntled LandLine Lid. I am in contact with several of the folks who ARE involved in the NE FlexNet network fairly regularly, both in Canada and the US.

Lots of LandLine Lids, and of course, hams who still cling to old, dead stuff like KISS do not like seeing the way FlexNet has engendered growth and enthusiasm that simply does not exist for their old-style stuff. Some of these luddites, having no rational arguement to make, and no truth to tell that would support the continued use of their obsolete "pet" software, tend to peddle bullshit, perhaps because that's all they can come up with to support their views.

Sour grapes..... Pretty pathetic.

Yes, I'm familiar with "The Packet Wars" for want of a better term. 1200 Baud is pretty clunky, but with rather large installed base, and Hams being what we are, I don't think there's much chance for a system wide "upgrade", at least not on 2M in the US.

I predicted the AMSAT Phase III would be a failure, and hoped
I would be wrong. I knew it would be a failure because nothing is
documented. The web page of North America hasn't changed in
a couple of years.

Now that we are done with that multi-million dollar fiasco that sucked
all the coffers dry, we need to start over, and get back to the microsats.
Ham Radio can't afford to operate this "pig in space."

Once we get an easy to track microsat, able to operate at 9600 (higher
speed is not necessary) we can do voice and data (digital voice) on the
same bird. After 10 years we should be able to get five of them up
there, and that would give you 12 hours coverage in most parts of the
world.

That's the only future packet radio has.

I was able to poke around that network myself.

Not much there ... compared to what WAS working prior to
(as the person involved called it) the "Flexnet disaster".

But you must know much more about the situation of course.

Ok, over the weekend I decided to take the plunge and try the various digital modes. The modes I've played with over the weekend include PSK31, SSTV, and RTTY. I know there are more out there, but I haven't had time to mess with them yet. Here is my question, dose RTTY on 30m use a different configuration than on the other bands. I can copy RTTY fine on 20, 40, and others, but on 30m I can't see to copy anything. While tuning what I thought was a RTTY signal with MMTTY I notice that the signale had a much larger sift that with RTTY on other bands. It there a different configuration for 30m than with other bands, or

perhaps this is just another mode that sounds similar to RTTY. Any
Ideas?

P.S Please reply to the newsgroup as other may have simular questions.
If you must reply via e-mail please use the address listed in QRZ de

Of course you are normally not going to put the raw sample from the card into an on-screen array, for any useful purpose except maybe a first contact with this matter.

Normally you will need to do demodulation, and that involves processing of a series of samples, possibly a sliding window across the incoming samples. It will involve filtering (e.g. using a FIR or IIR filter), often some form of phase lock, etc.

What is often seen in programs is that there is a piece of code that handles the buffers with samples as they come in, and does the demodulation part of the job. That part will put the demodulated bits in some form of pipeline for the presentation part of the program to handle it. Then the demodulation (which is kind of real-time) is decoupled from the presentation (which is often tied quite closely to the user interface).

Rob

You have to remember that most "safety" related laws and rules are written for the lowest common denominator in society. Just because YOU can safely drive a car on a particular road at 70 MPH, does not mean that everyone else can. And since personal responsibility and prudent judgement seems to be at an all time low in this country, we have been more or less forced to have the rules dictated to us. It's a shame for those of us that feel that we're "better" than that, but the law is the law, and you do not have the right to arbitrarily disregard them. Organize a lobby, study and document your evidence as to why a particular law should be changed, and present it to the proper governing body, and let the process do its thing.

I am very much in favor of personal responsibility, and despise the
government meddling in my life. But you have to realize that there are a
great many peope in this country that are NOT responsible, and do NOT
exercise good judgement. It is THESE people that the laws were written

for. As long as people demonstrate that they could not behave themselves if left to their own desires, then the government will have to regulate them. This news group is a perfect example of why we need rules and regs. Too many people operate potentially dangerous equipment with little or no regard for other people's rights, yet they are the first to piss and moan when the law bites them. It's hard to make a case in favor of that type of mentality.

I have a limited number (20) of PC boards for a sound card interface which I designed specifically for the IC-756PRO. It should work fine with any of the Icom rigs (such as the IC761/765) which use the 8 pin DIN ACC(1) connector. The interface contains Rx and Tx audio preamps and isolation transformers. PTT can be keyed via an optical isolated serial port interface or via an internal VOX type circuit which has been designed to work well with the digital modes. All I/O lines are filtered with chokes and bypass capacitors. An on/off switch routes all ACC(1) connections to an identical connector when the interface is turned off. Front panel controls for Rx, Tx, and VOX gain work independent of the rig's volume, mike gain, and vox gain controls. Fits in a standard MicroPack "C" enclosure by Lansing Instruments.

These boards are available at my cost of $21 each plus $1.50 shipping. I can send you a zip file with PDF format schematic and parts list. If you are interested e-mail me directly at: rlewis@staffnet.com

You might also have a look at:

http://www.qsl.net/wa0ttn/PSK31.htm

This is Moe's PSKCore DLL code wrapped in an ActiveX control. A lot easier to use in a VB app than the DLL. If all you're interested in is the raw data, you can set the control's Visible property to False and call GetRawData when the DataRdy notification event fires.

Hey Rob...Why are you and your freeband idiots crossbanding your petty
junk into an amateur antenna newsgroup?  Can't you keep this crap in
some "who cares" newsgroup?

Thanks!  I'll try tinkering with it and see what comes up -- it'll be
interesting
to see what traffic I can pick up, if it works ;-)

Hey joe ... Why do you believe I give a damn about making sure the posts are in the correct forum? This is where it started and this is where it will end. And trust me I do not condone freebanding whatsoever.

I have a Bensat  FM ATV rev'er for 900mhz and 1.2ghz. Less than a month old.
I just rec'ed
a wyman unit so I don't need it any more. this
cost brand new 150$ I will trade for a video ELK board or 220 mobile. or
125/bo$.you can see this sat rev'er on PC electronics web page.

And although you may think you can safely drive on a particular road at a particular speed, you may be over-judging your abilities.

I heard of a survey once that found that something like 90% of people though they were above average drivers. Now if they were correct, it means the distribution is very skewed; there must be some REALLY REALLY awful drivers somewhere. It's more likely that they are just too confident and can't properly judge their abilities.

The fastest speed limit in most states of Australia is 110km/hour, which is about 69 MPH. It's fast enough for a legal limit.

FYI on lower speed limits...

The NMA recently received a special report from the Montana Department of Transportation on highway accidents and fatalities. Chad Dornsife, NMA
Nevada Activist, has created a web page that compares Montana's last 12 months WITHOUT a speed limit to their first full year of experience WITH a speed limit.

The new information shows that fatalities have more than doubled on rural
interstates and has also increased on rural primary highways. This information contradicts the state officials who claimed speed limits, higher fines, and more enforcement would lower traffic deaths.

You can find the full story at
http://www.hwysafety.com/hwy_montana_2001.htm
If you have any

Yes, the client application code is available, and that is great!

I can't find any source code for the signal processing library
though  (which is the "rocket science" here :)  That was the part
I'd really like to see.

I'm trying to connect my IC706MKIIG to a KAM'98 through the data port on the back of the radio. However, I'm having trouble locating a connector which fits in this port with wires or terminals protruding from the back that I can use to hook-up to the TNC connector. Anyone have any suggestions?

Thanks in advance,
-Robert

Hello All!

I have uploaded upgrade to TrueTTY 1.77 beta to the main site and mirror:
  http://www.dxsoft.com/truettyb.zip
  http://www.hamradio-software.com/truettyb.zip

Your feedbacks are welcome.

Best regards,
Sergei

Windows HAM radio software at   http://www.dxsoft.com

===

TrueTTY Versions History

V1.77
The old bug with Alt-T keystroke was fixed. Sometimes it was necessary
to click on them twice to switch transmitter on.
If there are several sound cards in a computer, you can select
the card by the "SoundCardNumber" parameter of [RTTY] section of
TRUETTY.INI file. (SoundCardNumber=0 , SoundCardNumber=1 etc.)
V1.76
HF-PACKET (300 bps) monitoring was made (Mode->AX25).
[...]

===
TrueTTY digital communication software.
Program for amateur radio digital communications via a sound card.
Supported modes are RTTY (Baudot code), ASCII (7 or 8 bits), PSK31 (BPSK and QPSK) and
AMTOR-FEC (SITOR-B, NAVTEX).
SELFEC SITOR decoding is possible also. No additional hardware
required - you need only transceiver and computer (5x86-133,
Pentium-75 or better) with sound card. Optionally you can use simple
circuit for PTT-control. It make fast and convenient frequence
control, has a lot macros for tramsmitting. Can cooperate with RZ4AG
AALog logger.

Mine came with connectors for the ports on the back. They didn't have wires on them, but it's not too difficult to solder what you need onto them. You might also want to try a well-stocked Radio Shack for the connectors.

My apologies.
I overlooked the last link on the page, and only looked
at the 2.x version and the DLL code.

Thanks a lot for pointing it out..

MFJ sells the 13pin connectorized cable marked for
Kenwood radios, but works fine in the Icom.

The 6pin miniDIN connector is used on much computer equipment. Radio
Shack sells the connectors with no cables. I wouldn't be too suprised
if MFJ has them, but haven't looked.

Here's some of my /etc/ax25 scripts. Soundmodem works FB with Kernel
2.0.36 patched on a SuSE (www.suse.com) 6.4 box as well as with newer
2.3 (and 2.4?) kernels. I even have Soundmodem, LinPSK and a whole
portable ax.25 node all in a teeny "notebook" form factor.

```
root@fritz:/home/kg7fu > cat /etc/ax25/start_soundmodem

#!/bin/bash
#
#soundmodem based packet station
#
#clean the sound drivers
```

```

This is how I start packet networking on my server box. It's main function, other than a DOD internet router, is a CLX DX Packet Cluster.

Try some debugging flags and mail me your /var/log/warn & /var/log/messages files if you still have difficulty.

When I boot my PC it momentarily enable the PTT line setting my transceiver to transmit. I have the PC connected to the transceiver for data communications and it is connected to the PTT line in the usual way.

I believe there is a small TSR programme which I can use to stop this spurious PTT signal during boot up. Can somebody please tell me from where and how I can obtain a copy.

Thanks.

Allan

I believe the TSR program you refer to is desinged to prevent the
continuous assertion of the RTS and/or DTR in Windows ME. I think the
momentary assertion you are experiencing is a normal function of the
bios testing and initializing the ports. At least on the computers I
have the momentary assertion occurs before Windows loads and it occurs
in a boot direct to DOS. I've not found a solution other than to make
sure the rig is either off or disconnected when booting the computer.

Hi Fellow Warblers.. for your information MixW 2.0 RC#2 our Shareware Version of OUR FREEWARE DigiPan is now posted on our Website.. the URL is: www.nvbb.net/jaffejim/mixwpage.htm Unlike our FREEWARE DigiPan, MixW 2.0 RC#2 does all the Digital modes including the old favorites such as CW, RTTY FAX Pactor FEC and Amtor FEC plus SSTV and MFSK QPSK, BPSK Hellschreiber and Throb. Feature the same easy pull down menus as our FREEWARE DigiPan so the learning curve is very minimal.nothing really to memorize has full contest logging high speed normal logging CAT and Rotator control. You can download and test out the program and see for your self.. Please again make note of the new website as the old URL has been changed. Best 73 and Happy Warbling.. Jim, WA2VOS

Hi Fellow Warblers.. I must apologize for typing in the new URL and forgetting to add the tilde in the appropriate spot. I made a mistake in tying in the URL for our Website which should have read : www.nvbb.net/~jaffejim/mixpage.htm some how the "Tilde" was left out.. The new website address for both DigiPan and MixW software is www.nvbb.net/~jaffejim/mixwpage.htm or for DigiPan it would read www.nvbb.net/~jaffejim/digipan.htm the home page of the site is: www.nvbb.net/~jaffejim and from there you can scroll down the page to the various Icons and get to any page you like. You can also go to www.qrz.com and the website and email addresses are always posted there and kept up to date..

We have released the next version of our Shareware PSK software titled MixW 2.0 which replaces our previous version 1.45. MixW now uses the same easy to learn interface as our FREEWARE DigiPan. Unlike DigiPan which can only do PSK/QPSK, MixW can do ALL the Digital modes including MFSK, Throb, Hellschreiber, FSK31, PSK, QPSK and then RTTY all shifts all speeds, CW, FAX, Packet HF and VHF, Amtor FEC mode, Pactor FEC mode plus contest logging and regular logging.. SSTV send and receive.. go to the website and download a copy and try it out for yourself.. MixW uses the same easy pull down menus and all the macros are displayed on the function keys and there is no need to read those boring manuals written in computer Tech Talk. Nothing to really memorize.. just boot up the program and fill in the "Personal Data" in the Configuration file and you're on the air with the very best program ever written for the Digital modes.. 73 and enjoy.. Jim, WA2VOS

You'll have to ask Thomas Sailer about newer kernel support if you
can't get it done from the tarballs, etc...

BTW Kai Altenfelder maintains Ham Radio support for SuSE. See what's
in their archive at ftp.suse.com/pub/projects/ham

From what I have heard, there is no "soundcard" driven softweare that
can do pactor, packet, or any of the modes that has error cqn
builtin. Also was told there wont be any written because it
simply cant be done without a TNC to do it.

Its not a matter of error checking, it's the critical timing of the
ARQ modes (such as Pactor and Amtor) that make it difficult to do on a
PC. There are sound card Pactor programs that run under DOS. I don't
think anyone has been able to accomplish it running under Windows
because Windows doesn't give good control over the timing of events.

Hello out there!

Has anyone been able to make the TS-2000 work (FSK-mode) on RTTY with
the PK232MBX via ACC2. I've had a TS-870 before and it worked just fine
(with the J7 FSK connected to the FSK input) alas this input is not on
the TS-2000. Also when working via USB/LSB it's possible to work RTTY
but the upstart is so slow (about 5 sec.) before full output, that it's
useless!

Any help will be appreciated!

The best PACTOR sound card program is RITTY version 2.38 by K6STI. It also
does RTTY. (But the later versions of RITTY only do RTTY).

RITTY is a DOS program. I believe that Brain K6STI still sells licences for
the old version 2.38 for RTTY and PACTOR.

Sorry! I guess I have to get new glasses! I owerlooked pin 2 in ACC2, so
now FSK works just fine. But I still have the slow upstart problem!

Aby help on that issue will be appreciated!

I am running HamScope and I like it very much, In the Spectrum mode I
have two traces displayed in two different colors, orange and green,
both look like receive signals but nowhere in the documentation does
it explain the traces.
Thanks, John k2bka

Is anyone familiar with this product? From their web site, it sounds like it probably has more versatility than anything else out there, but it certainly isn't cheap, and I can't locate any reviews of it (although I have sent them an email asking for references).

I have no experience using the digital modes with a sound card, and the only time I operated the digital modes was a number of years ago with an MFJ Multi-mode unit that got fried in a lightning strike and was never replaced. I certainly hear a lot of what sounds like PSK on the bands, and the prospect of software that could function both to operate in the digital modes and to enhance reception through DSP is an attractive one -- if it works.

Thanks.

Skysweeper has been around for awhile but I have not heard many stations use
it.

There are lots of GOOD FREEWARE single mode sound cards programs such as
Digipan for PSK31, STREAM for MFSK and MMTTY for RTTY. They work great and
you can't beat the price.

If you are looking for a GOOD MULTI MODE sound card program, check out MixW
and Hamscope.

MixW does MANY modes including PSK31, MT63, SSTV, RTTY etc but it is
SHAREWARE. Hamscope does RTTY, ASCII, PSK31, MFSK and CW. It is FREEWARE.

For MixW version 2.0 beta 4 see http://tav.kiev.ua/~nick/mixw2/MixW2rc4.htm
For Hamscope, see http://users.mesatop.com/~ghansen/

I have not used this product, but to get your feet wet in the digital modes there are plenty of very nice free ones at the following:

http://www.muenster.de/%7Ewelp/sb.htm

I have used several and they work very well. Digipan is nice for psk31, mmtty is very nice for RTTY. MMSSTV is good for SSTV.
To receive all you need to do is plug the audio from the receiver speaker in the sound card and to transmitt you go from the sound card speaker with a resistor network of about 100K and a 1K resistor to the audio in of the transmitter.

I'm having trouble initializing my KAM'98 (v. 8.3). With Pacterm 2.0, it
gets hung up on the autobaud routine. I've tried a hard reset to no avail
and the serial connector seems to be wired correctly. I'm not sure what
else to try; presently, I can't do anything with it until it's
initialized. Any suggestions would be appreciated.

Thanks in advance,
-Robert

I am registered user of Skysweeper and I have to say it's really powerful
software.
Perhaps it is not ideal for the beginners, but it is very useful for
experienced amateurs and professionals.
With SkySweeper you can build the receiver and transmitter architecture you
want (design filters and add spectrum analyzers, sine wave generators etc).

It currently supports many modes and I have heard, that the next versions of
Skysweeper will support MFSK16, MT63, MIL-STD, ACARS and chat box etc as
well.

I must admit that Skysweeper looks interesting. But it appears that it ONLY
will TRANSMIT in three modes -- CW, RTTY and PSK31. If I am wrong, someone
please correct me.

MixW and Hamscope transmit in more modes. (and Hamscope is FREE).

Skysweeper looks great for the SWL operator but for the Ham radio operator I
have my doubts whether it is worth spending the $$$.

The upper trace is an average of the data on the lower trace. Takes a lot of the time-jitter out so that you can get a better idea of the true signal spectra.

Can anyone tell me where the latest information for using 2.2 Linux
Kernel with AX25 is hiding?

I have been running AX25 on an older 2.0 kernel and I need to move
it all to a system that is running 2.2.19 Kernel.

The Latest AX25 HOWTO that I could find was several years old and only
covered the 2.0 Kernel configuration.

You need 3 packages: libax25-0.0.7, ax25-tools-0.0.6, ax25-apps-0.0.4
There are some newer unstable versions.
Redhat, Debian and Slackware offer the packages on their sites.
Configuration and apps are mostly the same like old ax25-utils.

From the kernel's point of view, no difference. Simply compile and install.

Soundmodem support in the kernel is no longer necessary.

Tom Sailer, HB9JNX has rewritten the soundmodem code so that it is now a
user-mode program and not part of the kernel. It uses the normal sound
card drivers and therefore supports a much larger number of cards.

See http://www.baycom.org/~tom/ham/soundmodem for the new version.

Excellent potential for a strong signal on 160M.
Some modification required.

> >Facility: WJHW FM 101.9 mHz 6 kW at 359 AAT

Probably not very useful except for parts.
Tower might support large 2M array, and the transmitter
might be modified for that band?

Is there any documentation for/with it yet? Last time I looked I couldn't
even find out what it was capable of never mind how you got it to do it.

I'm having trouble getting my NJQRP Warbler to work. I suspect it may be the
antenna has been overcome by vines since I can't copy much on 75 meters at
all around 3582.  Heard a W8 calling CQ on my good rig, buy couldn't copy
him on the warbler. Can any buddy local give me a hand?

Yeah, I noticed that also. I downloaded the tarball, but haven't yet
tried to do anything with it.

"Leland S. Van Koten" wrote:

> Is anyone familiar with this product?

Yes, I did a product review for a publishing company and tested SkySweeper against competitor products. SkySweeper has got the best rating for their analyzing/decoding posibilities and their graphical user interface. The only products capable of decoding more digimods are Hoka Code 3 products with a much higher price (1000 DM and up) and a simple DOS user interface which is not that good. If you do not need that many digimods to decode SkySweeper is up to now #1 ranking product for analyzing and decoding. Simply download the test version of SkySweeper and test it.

I'm new to this. I have worn out my search engine and printer d/loading
RTTY, Fax station..etc freqs and they are all from the mid 90's.
I'm in Atlanta and need to find some currently active freqs to decode. Any
help would be appreciated.

Hello....I'm just returning to Ham radio after a 5 year lull (although
I have
had occasional contacts during the lull, primarily on 10 and 2 meters
mobile).
I've just recently connected my old TNC to my 2 meter HT and am
surprised at the dearth (to put it lightly...I've received NO signals
to date) of activity in packet.  The last time I used packet it was
still fairly active.
I've been monitoring both 144.95 and 145.05 but no signal yet.  Which
frequencies are most active in the Cincinnati area?  I used to hang
out on the above frequencies as they were fairly busy but not too
busy.  Granted, my setup isn't optimal.  I'm using an Alinco DJ-560
with an AEA 5/8 wave telescoping whip as my rig and antenna, but given
that I live on the third floor (top) floor of our apartment building,
I would expect to receive at least the occasional signal.  Has packet
been replaced by the internet to this degree?  I hope not...I miss
getting the ham news via packet and hooking up with the occasional ham
for a 'live' one on one chat.
            Craig KB8FGC

>Yeah, I noticed that also. I downloaded the tarball, but haven't yet
>tried to do anything with it.

I've compiled it anf got it working on an old PC. As indicated the documentation
was totally absent, and worst of all it required me to compile all of the

following other packages to _compile_ it:

X11 and libraries (!)[The shack PC doesn't run X11 it uses an ethernet
card to my usual HPUX workstation from which I administer all]
GTK 1.2 (!!)
libxml
GNU Autoconf (configure didn't work out of the box)
audiofile library

I used about 500Mb of disk space in doing so. You can avoid the X11 parts if you have an example soundmodem.conf file, so here's mine:

```
<?xml version="1.0"?>
<modem>
<configuration name="mine">
<chaccess txdelay="150" slottime="100" ppersist="40" fulldup="0" txtail="10"/>
<audio type="soundcard" device="/dev/dsp" halfdup="0"/>
<ptt file="/dev/ttyS0"/>
<channel name="Channel 0">
<mod mode="fsk" bps="9600"/>
<demod mode="fsk" bps="9600"/>
<pkt mode="MKISS" ifname="sm0" hwaddr="M5AIQ" ip="10.0.0.1"
netmask="255.255.255.0" broadcast="10.0.0.255"/>
</channel>
  </configuration>
  </modem>
```

Dummy IP address left deliberately :-)

Despite these complaints it works much better than the kernel mode stuff which I had no end of trouble with. Documentation, non-use of XML for the conf file and making the GTK stuff optional would make it a very good suite!

Craig,

To my knowledge, all activity is now on 145.01. Try and connect.

Regards,

WB8NUT (Anderson Township)

Thanks for the tip.  I think I found another reason for my trouble
tonight.  As it turns out, the battery in my HT has gone bad, so I was
running the HT while the battery was plugged into it's charger.  This
was putting an AC hum onto the signal.  Have now switched over to my
old ICOM 2AT and a big battery.  To connect to your station, is it
simply WB8NUT, or would it be WB8NUT-x (where x is an integer)?
         Thanks again,
              Craig

>How?

Well, he is right in that the installation of these programs requires
a lot of software that normally isn't installed on the system. Maybe when
XML is more widely used, this is less of a problem.

I installed the AO-40 telemetry decoder Thomas wrote, and it was the same
ordeal.   I had to go back to the system administration tool and install
yet more libraries at least 3 times.

Of course this all is a one-time hurdle. But I expect it is too much for
most of the users. That is a pity.

Rob

Yes. It would make the configuration file editable by hand.

Presently you have to use a GTK+ app. My packet radio machine has no local disk (NFS root file system) and has little CPU power or RAM, so I don't want to run X apps on it particularly.

No, you don't.
XML-files are easily editable by hand. Below you can find the configuration file I use for testing. It's easy to understand and can be modified using vi, emacs, teco or your favourite editor :)

Windows is a fad. VT-100 rules...
Command-Line or death...

Actually, if your "little CPU power" can't afford to run
Windows, it can't afford to run DSP either.

Sorry if I was unclear. The machine has plenty of CPU power, but it's
using an old 270Mb disk and runs headless (i.e. no monitor attached).
I didn't mean to sound unduely critical, but for what is essentially
another network service, there shouldn't be a need for X11 to configure
it. Nor should there be a need for there to be quite such an
installation ordeal for code which should only be fussy about the sound
system. I can configure vastly more complex systems like smail without

needing a GUI. At the very least some documentation about the config file format would be helpful (or even an example); hence my example which I posted previously.

I'm having trouble getting my Warbler up and running.  I seem to need more
audio, and I can't get the trimmer capacitor to center up on 3881 mhz per
the instructions.  Frequency movement stops at 3881.3 mhz.
Can any give some hints off list?

Was it really necessary to spam every radio group?

It took less than two minutes to find that ricochet uses 900 MHz
and 2.4 GHz ISM bands with frequency-hopping spread spectrum.

I have an Alinco DR-150 setup here with Linux 2.2.19 (I'm currently watching APRS packets because I can't seem to find any Packet BBSes in the area). But I don't have a manual for the radio and I somehow turned on the channel scope function which puches holes in the audio and changes the way the display looks.

Does anyone have any idea how to turn off channel scope? Or where to get a copy of the manual (yes, I;ve tried the alinco website. They have all the manuals except the DR-150, just my luck).

Thanks,

Brian

Hi,

Does anyone have info on the Navigation Communication Systems meridian satellite navigation hardware ... other trade name involved is intech ... it is circa 1984 and has an 8085 micro processor board in in connected to an amphenol connector backplane.

I believe the satellite system is now inactivated .. however the box has a nice 16*2 lcd display , 16 key pad .. micro controller board and a 5 MHx crystal oscillator .. all quite nice

I would like to use the micro and display/keypad and box to be the basis of a receiver I wish to build ...

If anyone has info on the hardware or firmware please let me know

Thanks

Stephen

It _can_ be edited that way, but you shouldn't have to. A plain
old text file would have been simpler.

The box I described has enough CPU power to run the 1200 soundcard
modem in linux. It's been that way for over a year now.

G'Day and thanks for reading this message...

I currently have LM 7.2 up and running with ax25 and
LinPac0.16pre1 which currently works. I am in two minds as to
whether to upgrade to LM 8 for the sake of updating .. Is there
any reason to upgrade to LM 8 ? Curious as to other peoples

reaction and opinion to LM 8.. Many thanks in advance..!!

Hi guys

I've got myself a Prom Programmer made by Data I/O of Redmond, Washington in 1984. It's a Model S22 Version VO2 and I'm trying to obtain some spec, and driving instructions. Anybody got a manual? I'll cheerfully pay costs, 'cos I'd really like to get my Storno and Midland ex-pmr rigs reprogged.

A plain old text file *might* be a little simpler, but not much. It still needs to contain all the same information and organization. Using XML leverages an existing body of (relatively) standardized parser and processing implementations that otherwise would likely be crafted anew especially for for each different program.

While I'm not an XML zealot, I believe the use of XML for such configuration files is, in general, a step forward.

```

Hello, I am portable on the 3rd deck of hotel. I have a perth plus vertical antenna on the balcony, have also tried random wire from balcony, the problem I have is when I turn my computer on the noise level on my rig (IC706MKIIG) goes way up around 10 over sometimes 40 over, on every band below 12 meters. 12 and 10 are quiet but anything between 160 and 15 I can't work because of the noise level my computer is putting out.

Here is what I have trouble shot so far. I know the noise is comming in through the antenna and not the rig or the coax. I have grounded to a cold water pipe, the ground hole on the wall socket, a grounding rod into the ground three stories below, but no change in noise level. I can't get any farther away from my antenna.

Any ideas? Thank you for reading this.

Still doesn't stop that idiot who is going to end up losing control of his car because he feels he should drive whatever speed he wants (since there wouldn't be any limit for him to abide by) and then crashing into my car. See believe it or not, MOST laws are there for the protection of OTHER people, not the offender.

Ya can't drive drunk under law because you are a danger to others, not yourself.

> If you mean Clinton, you sure have that wrong. The safety nazis
> love Cintonites because they all want to tell you and me how
> we should live our lives.

The amusing thing is ... the laws you do enjoy are exactly that. You know
like: murder, rape, robbery, assault, stalking, etc etc etc ....

The laws are there because the average person is too stupid to realise just
what is good and what isnt

> If YOU can't handle it, then don't. No one is forcing anyone to

> drive 70.

My ability to handle the road is irreevant. Fact is there will be 10 idiots out there that will take full advantage of a no speed limit idea that can't handle the road well at 65 let alone 70+ and end up killing off a great deal of the population ...

> Nope, the national 55 in effect for some 15 years had NOTHING to do
> with safety when imposed. Since it has been lifted, highway detaths
> per year are STILL dropping.

What source did you get that info from?

> Many states it is now 70 or even 75. In NJ people routinely
> drive 70-75 everywhere on the highway...totally ignoring
> the posted 55 or 65 limits.

And New Jersey (Joisey I should say) is a state to model after?

Very true. Few people are aware that he was actually appointed to the office by a committee of Elvis impersonators. GW was the second choice, but since Barney declined the offer ....

Hi,

I just picked up a Kantronics Mini-Reader (decodes Morse and RTTY) at the local ham flea market - no documentation. I need information on connections and on general operation.

Any help would be appreciated.

Anthony VE3ZAF

Face it, George looks like a monkey and is dumb as snot. As bad as

Clinton was, and as slug-like as Gore was, the republicans are so bad they can't honestly win against them. Think about that!!!!

A top republican in Atlanta that was heading the impeach Clinton movement resigned recently because he was caught (a second time) exposing himself in a public park...and soliciting sex from an undercover policeMAN (not police WOman).

Republicans are more likely to have sex with Yasser Araofat and his male camel than women. Like they did with congressional pages.

How about some technical data proving your claim about republicans not liking to have sex with women? Statements like this cast a 'lot of doubt' about your abilities in other areas, such as electronics etc. I mean this is such obvious bullshit, it makes me wonder if your learned comments on other things might also be bullshit!

And yea, I'm a new republican, got so disgusted with Clinton and company, I changed parties, and I still like women!

I presume you still support Clinton and hold him in high regard. He was such a outstanding example of a President of the United States, wasn't he, ugh! puke! I don't know about you, but I was totally embarassed and ashamed to have him represent us/me to the entire world...!

And since we are on the subject of headers:

It is time for my monthly disclaimer, in case any newbies have arrived since Leland's last folly with my nic and email.

.
KC8LDO Leland C. Scott forged the original post, it wasn't me. His number of aliases and forged posts and emails are staggering, but he especially likes forging me. Please check the headers. Leland C. Scott, KC8LDO, and Doug Adair, N8wwm, and their many, MANY aliases are responsible for ninety five point nine percent of the strife on the rec.radio.cb ng, and probably on many of your amateur forums as well, especially lately. A good number of posts appearing with no call signs have been easily identified as the same forgers in the cb ng.

Thank you all for the replies via email, as most were polite and well written, as were the many offers to assist me in attaining a ham license, however, I believe in returning things to their rightful owners, so any additional correspondence should be directed at the author of the forged post and troll.

After exposing Leland for forging me over a month ago with the assistance of another licensed amateur, he has waged a personal vendetta against me.

He searched the web and found an article I wrote on freebanding for a hobby magazine over a year ago and has posted it numerous times in an effort to justify his own behavior towards myself and other cbers. He draws his own inferences and hurls unfounded accusations and insults. Leland's main line of defense has always been attack his accuser, no matter who it may be. If anyone would dare suggest Leland may be wrong, he has no defense other than to attack about "What you did" and it is usually a lie (from questioning one's sexual preference to threatening them).

He has repeatedly accused me and others of pirating on amateur frequencies, and nothing could be further from the truth. I understand how an amateur could feel so strongly as to defend his allocated frequencies, but attacking countless individuals behind phony names, forging people, forging email headers in his posts, throwing accusations left and right and refusal to remove anything personal and not on subject off the ng exemplifies what this particular individual and his two cronies are about. He also reported me to my ISP for "forging" (the gall) and was so certain it was me that he made many posts threatening that I was about to lose my internet service. When he received word it wasn't me from my ISP, this sent him into a rage, as it did when I first exposed him. He has accused me of forging for so long (pot, kettle, black) he now accuses my ISP of "lying" to him. I guess the more Leland decides to forge me in your amateur forums, the more frequent I must point out the error of his ways.

I asked Leland and "Sparky" to take whatever personal problem they may have with me to email and I will be glad to debate whatever merit they see fit, but as all will see, these two are more interested in calling names, perpetuating problems between operators and will not cease their childish games....hence the crossposts They don't WANT the strife to go away. I apologize that they feel the need to make you all a part of it, and I was going to ignore most of the emails and what was forged of me, but then the email I received from amateurs was so far from what I expected. Leland forged me and posted that article in a manner to which I would be flamed, and instead, I received email from a great number of amateurs who didn't flame at all.

Quite the opposite, many offered to assist in getting my ticket, and for that I thank you. Turning the tables, if it had been me that were a licensed operator and someone posted an article about freebanding in an amateur format I frequented, I may have been one of the flamers, but as I said, the reaction from amateurs across the land was quite different than what the original author intended. If a post appears to be from me in anything other than the cb ng, please check the headers....if it has any other path than this one, it is a forge. All emails answered. Have a good day.

Hi Jerry,

You have poor reading skills OM.

On Tue, 8 May 2001 07:32:26 -0700, "JerryL" <jlockett@onemain.com>
wrote:

>How about some technical data proving your claim about republicans not liking to have sex with women?

Never said that. One example is Newt. He had an affair with a female member of his staff before he resigned..

Here is what I said:

>Republicans are more likely to have sex with Yasser Araofat and his male camel than women. Like they did with congressional pages.

>Statements like this cast a 'lot of doubt' about your abilities in other areas, such as electronics etc. I mean this is such obvious bullshit, it makes me wonder if your learned comments on other things might also be bullshit!

What is BS about it?

1.) Bush looks like a monkey

2.) We had a problem in the House and Senate with congressmen and senators having sex with pages

3.) The Republican heading the "let's get Clinton" group was arrested TWICE for exposing himself in a park and for soliciting sex with a male undercover decoy in an Atlanta park

>And yea, I'm a new republican, got so disgusted with Clinton and company, I changed parties, and I still like women!

Good for you. We really ought to throw all the bums out.

Before someone whines about Clinton, we should insist he not have an extramarital affair himself. Before someone heads a crusade to prosecute someone else for banging a 21 year-old-female and lying about it, we should make sure he isn't "hanging out" in public parks trolling for young males.

>I presume you still support Clinton and hold him in high regard. He was such a outstanding example of a President of the United States, wasn't he, ugh! puke! I don't know about you, but I was totally embarassed and ashamed to have him represent us/me to the entire world...!

Frankly, both parties embarass me. I'm ashamed of many of them, and embarassed that people think either party does not have more than its fair share of dishonest members and even the occasional pervert.

Why on earth would anyone think that a certain party affiliation means the people are honest or moral?

We let them all get away with far too much.

Now think about this...it is important. As bad as Gore was...and as
disliked as Clinton was....the best the Republicans could do was Bush.
They fielded a candidate that actually LOST the popular vote to
someone like Gore!!!! Phew!

Embarassing, isn't it?

Well I may have 'poor reading skills' but I take issue with you painting all people of a certain grouping with the same paint brush about their sexual perferences...There are wierdo's in any group, but not the whole group, and there is a hellva difference between Joe Blow congressman or anyone else and the President of the United States..No matter what, the President should keep him or herself above reproach in all matters, or at least be decrete about it for crying out loud and then lying about it on the national media, sheesh! To much!!!

As for ....the best the Republicans could do was Bush. They fielded a candidate that actually LOST the popular vote to someone like Gore!!!! Phew!...the last I heard on the evening news was that 'all the big time newspapers' that paid to finish the recount down in Florida, much to their chagrin, finally admitted that Bush won anyhow no matter how Gore and company tried to slant it!! As a note of interest, I didn't vote for either Bush or Gore, my candidate lost out early on....!

Take a hard look at what Dubya is doing/not doing with the oil companies right now, think back to what he had to say about the oil business during

his campaign, and then take a look at the the modern Bush oil pricing
structure. Now, aren't you proud to have voted for such a guy? I didn't
think he could sell out in such a short order, but I underestimated the
fool.

You are correct there Jerry as much as they cried and whined Bush still came out on top after the Newspapers finished counting. Tom by what percentage did Bush lose the popular vote? Pretty miniscual wouldnt you say. Last time I looked this country elects presidents on electroal votes. Since the democrats had dead people voting and convicts perhaps we should have a recount .

No you shouldn't say that, it is New Jersey(Jerzee), perhaps if you knew how to speak correctly you would be able to say the name of the state correctly. Which state do you think we should model? Oh that's right you aren't from the USA, what the hell would you know.
.

And since we are on the subject of headers:

It is time for my monthly disclaimer, in case any newbies have arrived since Leland's last folly with my nic and email.

.

KC8LDO Leland C. Scott forged the original post, it wasn't me. His number of aliases and forged posts and emails are staggering, but he especially likes forging me. Please check the headers. Leland C. Scott, KC8LDO, and Doug Adair, N8wwm, and their many, MANY aliases are responsible for ninety five point nine percent of the strife on the rec.radio.cb ng, and probably on many of your amateur forums as well, especially lately. A good number of posts appearing with no call signs have been easily identified as the same forgers in the cb ng.

Thank you all for the replies via email, as most were polite and well written, as were the many offers to assist me in attaining a ham license, however, I believe in returning things to their rightful owners, so any additional correspondence should be directed at the author of the forged post and troll.

After exposing Leland for forging me over a month ago with the assistance of another licensed amateur, he has waged a personal vendetta against me.

He searched the web and found an article I wrote on freebanding for a hobby magazine over a year ago and has posted it numerous times in an effort to justify his own behavior towards myself and other cbers. He draws his own inferences and hurls unfounded accusations and insults. Leland's main line of defense has always been attack his accuser, no matter who it may be. If anyone would dare suggest Leland may be wrong, he has no defense other than to attack about "What you did" and it is usually a lie (from questioning one's sexual preference to threatening them).

He has repeatedly accused me and others of pirating on amateur frequencies, and nothing could be further from the truth. I understand how an amateur could feel so strongly as to defend his allocated frequencies, but attacking countless individuals behind phony names, forging people, forging email headers in his posts, throwing accusations left and right and refusal to remove anything personal and not on subject off the ng exemplifies what this particular individual and his two cronies are about. He also reported me to my ISP for "forging" (the gall) and was so certain it was me that he made many posts threatening that I was about to lose my internet service. When he received word it wasn't me from my ISP, this sent him into a rage, as it did when I first exposed him. He has accused me of forging for so long (pot, kettle, black) he now accuses my ISP of "lying" to him. I guess the more Leland decides to forge me in your amateur forums, the more frequent I must point out the error of his ways.

I asked Leland and "Sparky" to take whatever personal problem they may have with me to email and I will be glad to debate whatever merit they see fit, but as all will see, these two are more interested in calling names, perpetuating problems between operators and will not cease their childish games....hence the crossposts They don't WANT the strife to go away. I apologize that they feel the need to make you all a part of it, and I was going to ignore most of the emails and what was forged of me, but then the email I received from amateurs was so far from what I expected. Leland forged me and posted that article in a manner to which I would be flamed, and instead, I received email from a great number of amateurs who didn't flame at all.

Quite the opposite, many offered to assist in getting my ticket, and for that I thank you. Turning the tables, if it had been me that were a licensed operator and someone posted an article about freebanding in an amateur format I frequented, I may have been one of the flamers, but as I said, the reaction from amateurs across the land was quite different than what the original author intended. If a post appears to be from me in anything other than the cb ng, please check the headers....if it has any other path than this one, it is a forge. All emails answered. Have a good day.

Thank you all for the replies via email, as most were polite and well written, as were the many offers to assist me in attaining a ham license, however, I believe in returning things to their rightful owners, so any additional correspondence should be directed at the author of the forged post and troll.

After exposing Leland for forging me over a month ago with the assistance of another licensed amateur, he has waged a personal vendetta against me.

He searched the web and found an article I wrote on freebanding for a hobby magazine over a year ago and has posted it numerous times in an effort to justify his own behavior towards myself and other cbers. He draws his own inferences and hurls unfounded accusations and insults. Leland's main line of defense has always been attack his accuser, no matter who it may be. If anyone would dare suggest Leland may be wrong, he has no defense other than to attack about "What you did" and it is usually a lie (from questioning one's sexual preference to threatening them).

He has repeatedly accused me and others of pirating on amateur frequencies, and nothing could be further from the truth. I understand how an amateur could feel so strongly as to defend his allocated frequencies, but attacking countless individuals behind phony names, forging people, forging email headers in his posts, throwing accusations left and right and refusal to remove anything personal and not on subject off the ng exemplifies what this particular individual and his two cronies are about. He also reported me to my ISP for "forging" (the gall) and was so certain it was me that he made many posts threatening that I was about to lose my internet service. When he received word it wasn't me from my ISP, this sent him into a rage, as it did when I first exposed him. He has accused me of forging for so long (pot, kettle, black) he now accuses my ISP of "lying" to him. I guess the more Leland decides to forge me in your amateur forums, the more frequent I must point out the error of his ways.

I asked Leland and "Sparky" to take whatever personal problem they may have with me to email and I will be glad to debate whatever merit they see fit, but as all will see, these two are more interested in calling names, perpetuating problems between operators and will not cease their childish games....hence the crossposts They don't WANT the strife to go away. I apologize that they feel the need to make you all a part of it, and I was going to ignore most of the emails and what was forged of me, but then the email I received from amateurs was so far from what I expected. Leland forged me and posted that article in a manner to which I would be flamed, and instead, I received email from a great number of amateurs who didn't flame at all.

Quite the opposite, many offered to assist in getting my ticket, and for that I thank you. Turning the tables, if it had been me that were a licensed operator and someone posted an article about freebanding in an amateur format I frequented, I may have been one of the flamers, but as I said, the reaction from amateurs across the land was quite different than what the original author intended. If a post appears to be from me in anything other than the cb ng, please check the headers....if it has any other path than this one, it is a forge. All emails answered. Have a good day.

Don't need to live there ... spend enough time in the hamptons and driving
to and fro in the upper east states ... And from my experience inahbitants
in NJ do pronounce it Joisey rather than Jersey

Thats funny as a lifetime inhabitant I have never heard anyone who lived
here call it that. The only "people" I have heard say it are outsiders such
as  yourself who have no clue
and mimic what others say.

    Not to mention that most states didn't count their absentee ballots
because they wouldn't change the outcome. Most of those were from our armed
forces that voted almost 3 to 1 in favor of Bush, that could have made up
most of the "popular vote".

Some of us may not like hearing it, but that's how it is. I guess it
will take a tie with Jessie Jackson before people wise up and field
better choices.

I'm embarassed at the quality of candidates we get with this system. I
can't understand why some people feel good about barely squeeking past
Gore, like that is a major accomplishment!

We are lucky Jesse Jackson didn't run, he would have probably won.

I don't want to see this point go unchallenged. The vote in each state is completely tabulated. To say otherwise is supreme ignorance. Every vote was counted, and was submitted. It is a fact that Gore won the popular vote, but it is also true that this is immaterial to winning the Presidency.

Americans do not vote directly for President. They vote for Electors. The candidate with the most Electors wins. The popular vote is an interesting count, but has no bearing on the Presidential election. It is equal in importance, to the count of voters complaining of constipation, in relation to those who have syphilis.

Finally, Bush won the Republican party because he had the most money. There were other good candidates, but Americans froze them out of the process by not contributing to their campaign. Both parties received a fraction of the total votes possible. More than 50% of voting age Americans never went to the polls. These same 50% always whine about the result.

Yawn....this whole line is a bore... you win Tom, have a nice life with old
blow-job BillC!!! I'm gone...!!!

de Jerry -n6jp-

>Your sense of humor sucks as bad as you sense of perspective.
You need to get a life away from thinking Republicans are better
than anyone else..or more moral.

Although it was intended as sarcastic humor, you must be aware
the Republican in Atlanta heading the "crusade" to get Clinton
disbarred for having sex (or whatever) has resigned because he
was caught a second time exposing himself in a public park and
soliciting a young male undercover cop for sex.

Where is Newt? Gone, because he was poking a woman on his
staff.

Frankly, Republicans and Democrats are both very poor examples
of what out public servants should be like. Now go away and stop
bothering me with this silly "Republicans are moral" crap. You can
pretend whatever you like, but don't fault me if you don't like the
>facts.

Oh, it wasn't up to him. It's just that his "friends" in the oil business know that he'll never use price caps nor controls. They couldn't care less that the extortionary oil price increases will be cause of Bush being evicted in four years. No matter- their additional billions will already be banked and Bush will be fully expendible and ousted at the polls, the economy trashed by universal inflation caused by the fuel price increases which impact *everything*.

So in the midst of record high profits by oil companies, and no sign of anything approaching a REAL shortage of petroleum products, just that allegation by those making the profits, prices rise to record levels (by collusion, no doubt). Nary an 'Out of gas" nor "limited to 10 gallon" sign to be seen (as in '73 when there was a REAL shortage).

Just today, radio news sources "within the oil industry" say that now the pipelines are again full, the 'shortage' is abating, so prices should start to come down, "Except on the West Coast and Midwest where there are special circumstances".(?) Of course, "down" will be somewhere around $1.50-1.75, which was exactly the objective of the entire exercise- get the prices up without just raising them "arbitrarily". (gotta have a 'valid' reason.) Fools that the pubic are, they'll never know what happened.

Sure wish we had a real political party in this good ol' USA. The Demoncrats turned out to be fools and the other side, crooks. Oh, the Clintoon admin. was able to work it both ways.

Or maybe the reverse. News reports (not generally reported by the liberal part of the media who almost universally supported Gore) say that millions of absentee ballots were NOT counted, ever, some 3 million in California alone, simply because they could not affect the outcome in the state in which they were cast. Absentees historically favor conservative candidates. So it could easily be that the popular vote is never going to be known accurately.

And you may ignore another fact, if you wish, but I live in a state where the Democratic machine routinely steals elections in metropolitian areas, and gets away with it. So it happened this time, too, with plenty pf press coverage that wss unavoidable under the circumstances, and do you *really* believe that the Democratic administration installed by that fact will proceed to do a proper job of investigating?

I would try to operate the radio with the computer turned off. Years ago, we used to do that all the time. Worked great . . .but a little tough on the digital modes.

I've been lurking and doing searches, and downloaded several programs
to monitor packet radio through the sound card (DSP) but what I'm really
after is if there is some simple coding (VB5 preferably) where I can 'read'
the card directly, so that I can try the rest (displaying the waves on an
'oscilloscope' and applying octet decoding and such) myself. All that I
could find in the 'help' menu about sound cards is how to record to WAV
files, but not seeing real-time samples in numbers that I can put into
arrays
for processing.

Since you mention VB5, I guess it's for win32-platform?

I would recommend that you checked out the DirectSound interface
(check the libraries at msdn.microsoft.com for details)

What you do is something along these lines:

```
  1. setup sample-rate, resolution etc.
  2. Enter a loop
  3.   request a buffer of samples from the sound driver
  4.   do your maths and graphics
  5. goto 2
```

You would probably like to do the sampling asynchronusly,
so that a new set of samples can be acquired while you're
doing your processing and displaying. IIRC, you can set
up a callback function that DirectSound will call whenever
a new buffer is ready.

I have no problem with DWI laws. I do have problems where
speed limits are set lower than anyone rationally drives. I have
never suggested allowing unlimited speeds...although there
are certainly highways in the west that can and have had
only "reasonable and proper" as the limit.

The problem is that the safety nazis want everyone to abide by
their version of what is or should be safe. None of that
crowd trusts anyone as an individual.

Cheers,
Bill K2UNK

All,
    I'm trying to connect a KPC3+ to the data port on the back of my FT736,
the TNC is receiving audio fine. but how does the TNC make the 736 switch to
Tx:? the Data port is just three pin, data out data in & Ground. I'm sure
somebody can help me here.
Thanks
    Huw

From the DB9 you have data TX data RX and ground on the 3.5mm stereo plug and a seperate PTT cable with an RCA audio connector.

Hi

I found in my station, that the monitor was causing most of my noise from the computer.
Try booting your computer up and then just turn off the monitor. The computer will not know it's not on and if most or all of the noise goes away, then you know what you will need to do, get a new monitor.

I bought a NEC 17" monitor, (cost about $260) and it has no detectable noise at all. My old monitor was a Dell VS15. The better monitors seem to be quieter than the cheap things that come with the computers.

Also you might try grounding the case of the computer to the radio, and put ferrite chokes on ALL the lines that come in or out of the computer. Especially the keyboard. Many people forget the keyboard has a simple computer in it too.

Anyway I wouldn't be surprised if most of the noise is coming from the monitor.

Many Thanks for the information, I assume its pin 3 on the DB9 and the TNC
grounds this to transmit?

Ken,

You didn't mention the computer set up but assuming that you are using a conventional set up. I suggest that the vast majority of you noise is coming from the monitor. That's easy to check just turn the monitor off with everything else running.

That was the problem I had and the only good fix I found was to replace the monitor with a LCD. Now using the LCD flat screen monitor I can not tell any difference receiving if the computer is on or off. A rather expensive solution I agree but it does work. Anyway sure worked for me.

Pretty much nailed it -- I was thinking of more like:
1. Setup, including look-up table for screen coordinates
2. Loop
3. Read Card
4. Enter byte into array and increment array counter
5. Display pixel at (Time,Amplitude)
6. Goto 2 unless key/mouse clicked
7. Do maths for 'presentation' and reading octets

I figure that steps 3, 4, and 5 shouldn't be too long in cycles, especially
with
a lookup table with the trig and such 'spoon-fed'. 5 could be dropped if
the
sample rate gets too bogged down, though.

Hi,

  I have seen about the sound card TNC.
  I was wondering what it can do. Could I do 9600 FSK? Or what is it able to
do?
  It sounds very interesting.

Thanks.
Richard KC8ESJ

No. They purchase speed radar detectors so they can slow down when they
approach a cop out trying to bust them....

Hi All,

Has anyone purchase a Pharos Streetnav? What is your opinion of this receiver?

I would be using it in a balloon payload.

73,
Chris Vancil (KD7LRV)

Flexnet includes a sound card TNC which can do both 1200 bps and 9600 bps packet. Unfortunately it is quite a complex program that requires lots of configuration.

For details see the flexnet homepage which can be reached under "http://www.afthd.tu-darmstadt.de/~flexnet/index.html"

I've got a PK232MBX that I'd like to use with WinAPRS, but apparently I need
a config file for WinAPRS to initialize it. Can someone point me to one ?

TIA!

Old Kenwood manuals are being sold by Howard W. Sams & Co. Indianaoplis, IN.

I tried to get them from Kenwood, but was directed to Sams whom made a copy
of the old TS-820 manuals for around US$29.95.

From what the person at Sams told me they have reprint rights to several
other manufactures as well.

Due to circumstances I had to get out of radio back in 1992. Then I only held a tech + license, but really enjoyed vhf packet operation. I've now been able to get back into the hobby with both feet and currently hold an advanced ticket. The problem is that I don't find much digital activity on vhf and so I thought I'd start looking through the HF bands. I have a PK232MBX that I've been trying to listen to some of the signals with but can't seem to decode the transmissions. I've been reading about the "newer" modes of digital transmissions and am trying to decide if it would be better to upgrade the 232 for DSP operation or try to use some of the sound card programs that are available for download. My questions are: What are the popular modes that are being used presently for casual contacts? Has the HF packet protocols changed? Is there a website that might list common freq. for digital operations?
I am interested in just making casual, ragchewing contacts. Any inf. would be appreciated.

Threre have been several new modes the pk232 does not cover. The sound card programs work very well for the low band modes. Look here for some programs, many are free.

http://www.muenster.de/%7Ewelp/sb.htm

Especially check out Digipan. It is for psk32. I don't remember the other program name but there is also some programs that do multimodes. There is a rtty program called something like MTTY that is very nice. The psk32 usually is around 14.070 and also on other bands.

I have not operated a pk232 type modem but I have used an old st-6 for rtty and can tell you that the sound card programs compair very well to it.
Unless you want to just operate packet , I would for get about the pk232 upgrade.

I suggest not using it. You won't need the extra power on PSK31.

You don't even need the raw 150W, imho. I use about 50 max and
work the world.

I was just given a OTC 500 Automotive Meter which is used.. and
Unfortunately there is no booklets or manual.. What Im looking for is
the Url for the company who makes it or any other possible text on
it....

Please mail me at inemm@hotmail.com

Thanks a head of time...

Yes the new professional software supports TCP/IP but only for CLIENT applications. You must dish out even more $$ for TCP/IP firmware for host applications.

As a result, I don't see many Hams using TCP/IP over Pactor II.

The main benefit of the professional software is the ability to accept ROBUST connects. The Hayes mode is nice but you already have the same functionality and transparency with the WA8DED host mode.

I would like to see SCS expand the host mode to support RTTY, PSK31 etc. Then we might see some nice host mode programs for the PTC II.

Rob,

Thanks for pointing that out. It is clear in the documentation but incredibly I missed it. Not even being able to do development work without first acquiring the the host software is a big disappointment.

```

Our local BBS ops here in Townsville are using MFJ modems running at 2400. Does anyone know of a soundcard packet program which will talk to an MFJ modem on 2400 baud. According to the MFJ factory the tones are the same as 1200 baud i.e. 1200/2200 afsk. I have tried AGWPE, Flexnet Soundmodem and MixW. None o f these will decode packets from these 2400 baud BBS stations. My setup works fine on 1200 baud so I doubt there is a problem there. Any suggestions?

Ken VK4JUD

Bob,

The three most popular digital ragchewing modes today are MFSK16, PSK31 and RTTY. You can now operate on all of these modes using free software for Windows PCs with sound cards. To my knowledge there are at least a dozen free programs available over the Internet that support PSK31, three that will do MFSK16, and four that will do RTTY. The main differences among these programs appear to be the user interfaces; otherwise the performance on a given mode seems comparable among these programs. Links to (or copies of) most or all of them can be found at several places:
http://aintel.bi.ehu.es/psk31.html
http://www.btinternet.com/~G3VFP/download.html
http://www.n9vv.com/digital.html

http://www.psk31.com/
http://www.storm.ca/~ve3iay/digital.html
and probably lots of other sites.

HamScope 1.3, by KD5HIO (http://users.mesatop.com/~ghansen/), supports all three modes. MixW 2.0, by UT2UZ (http://users.nais.com/~jaffejim/downloads.htm), supports not only these three modes but a long list of other digital modes as well; it's free right now, but I believe you must pay a registration fee to use it after May 31.

I'd suggest you download one or both of these to start with, so you can listen to all three modes and see what they're like. For receive only, a simple patch cord from your radio's external speaker jack to the line input on your sound card will suffice to get you going. To transmit, you need a cable from your sound card's line output to an audio input (or microphone input) on your radio, possibly with an attenuator to control the audio level. You may also need some way to trigger the PTT on your radio (VOX works for me, but apparently this is not the case for all radios). The help files for these programs give details, or there are links from some of the above sites to detailed instructions on the Web. The same basic hardware hookup will work for all of the sound-card programs.

Look for PSK31 at 14.070, 21.070 and 28.120; MFSK16 is mostly found at 14.080, 21.080 and 28.080; and RTTY is found between .080 and .100 on these three bands.

Have fun, and welcome back to ham radio!

73, Rich
VE3IAY

Additionally, speed limits in many places are arbitrarily set
low.  The USA population routinely exceeds highway speed
limits and the police don't care one bit.

Cheers,
Bill K2UNK

And for most people, they are speeding just staying with
the flow of traffic on American highways.  Interstae 80 in NJ
is 55 for 30 miles before NYC.  The AVERAGE flow of traffic
is usually 65/70 or higher.  Anyone doing 55 is (or should
be) in the extreme right lane.

Cheers,
Bill K2UNK

Me too! I was quite disappointed to find that the host mode did not support all the other modes. Trying to make a nice terminal interface for any of the SCS boxes using anything but the command line gets real messy. Even the status word does not give a complete picture of what the PTC is doing because there are not enough bits to handle the newer modes that have been added.

Bob,
I mentioned this to Hans-Peter back in Feburary and this was the response I
got:

"We still think about adding full hostmode control for all text modes
(AMTOR, PSK31, RTTY) but as this is mainly an Amateur feature, it has low
priority. Would only be worthwhile if a developer of a hostmode terminal is
really willing to incorporate the new features into his program."

And I did tell him that we were trying to do that, and going between host
and Term 5 was a pretty major issue in supporting the PTC-II line.

Rick - W4PC

See thats what people don't understand a speed limit is a maximum not a minimum.

It should go like this

55   <55   <<55

not

>>55   >55   55

People hitting 70+ should be the ones getting off teh road and having their heads checked.

No it's for revenue enhansment. The cities need the money and most
cities use "traffic" for generating money as a lot of it isn't paid
for by residents. GOD help you if you violate in Royal Oak,Mi as they
have a brand new court bldg that is NOT paid for! Royal Oak police
allowed a video to be made once and it was broadcast, the sargent is
giving the beat cops hell so they will PRODUCE more. $$$

WHY? Do you believe for one second that the speed
limits on American highways are realistic? Do they have
any resemblemce to reality. Is 70 mph across Kansas
logical when there is visibility to the horizon, light traffic
and not a bend in the load for miles ahead?

Cheers,
Bill K2UNK

The intrastate highways were engineered for 70 mph even in the city,
and I do miss the days of "no speed limit zone". Problem is with fuel
economy, doing away with frames, lawyers and millions of idiots who
can't control there machine at speed.

The fantastic new sound card programs certainly demonstrate what kind of things can be accomplished with Windows software when it is fully integrated with the hardware. I would suggest that the PTC needs a "top down" approach at this point. Start with the software user interface similar to what is being done with some of the sound card programs and then determine what the PTC needs in the way of a host mode interface to accomplish that degree of integration. If PTC code space is a problem (which I doubt at this point) then you could always have a separate firmware load that could be flashed to provide the amateur host-mode. I'd suggest perhaps a "packet" protocol between the PTC and the computer in order to clearly identify it as "Tx/Rx data" or "commands".

Actually, all Han-Peter needs to do is send the other modes data through the Pactor channel in WA8DED extended host and many of the issues would be solved. You can send all the commands in WA8DED, as well as get status messages.

PLEASE CHANGE THE HEADER WHEN CHANGING TOPICS
I opened up several posts today and the topic dicussed had nothing to do with the header.
AND neither the header or the topic had anything to do with digital.

Come on folks - lets respect the Use Group Guide Lines at URL:
http://faqs.jmas.co.jp/FAQs/radio/personal-intro

AND FOR CRIPES SAKES __ CHANGE THE HEADER WHEN YOU CHANGE TOPICS.
I just read one with a header of "freebander" nonsense and it was discussing FM Quieting!!!

The only RIGHT way to do Packet on 2-meters is with a real TNC. I've done the gammit and let me save you alot of time!

I highly recommend the Kantronics KPC-3! You can find them on e-bay all the time! The newer KPC3+ is also nice and only a little more expensive.

When I used to run the "Monday Night Packet Voice Bet" in Southern California, we would get questional all the time about "how to get the BayPac working right". We would tell them to buy a real TNC.

The other advantage to having a TNC is the ability to have a mailbox without having the computer on.

Take my word on this...get a real TNC. Then do the next best thing, and get a Kantronics TNC! You won't be sorry!

Dino

>Hello All!
>

I agree! I don't think that it would be very difficult to implement. In my view, the main reason why we have NOT seen many HOSTMODE programs for the PTC II is the lack of HOSTMODE support for the other modes.   It is a real pain to switch back and forth between TERM 5 and hostmode.

I am also disappointed that the regular ham radio firmware does NOT implement hardware flow control. Almost EVERY other ham radio modem does but not the PTC II.   (Yes you can get it with the professional firmware version but only in the HAYES mode for PACTOR only!)

Apparently, the amateur radio firmware only implements XON/OFF software flow control but I can't seem to get it to work. Whenever I send a large file to be sent in RTTY for example, characters always get lost! (Yes my terminal software is set for software flow control and it works with other TNC's!). I must send bits of a file at a time to the PTC II. A real pain!!

If hostmode was implemented for ALL modes you would not have to worry about this problem! WA8DED host mode uses polling.

At the moment, is there a simple solution to my flow control "lost characters" problem (besides implementing delay loops)??

73's
Rob.

Is there digital software out there that will interface with the FT767GX CAT
control? Most of what I find works on the newer stuff but I know someone out
there is running a 767 for digital operation. What do you use?

If they can overtake you on the wrong side, then you have NO business sitting in the middle lane. There are no 'slow' and 'fast' lanes on British motorways. The Rule of the Road applies - you 'drive on the left and overtake on the right'. If lane #1 is clear, you should use it, no matter how fast you are going (provided that you are not constantly having to move into lane #2 or #3 to overtake). It is not your job to try and be a policeman, and create an obstruction by driving at the legal limit in the middle of the road.

Anyway, Walt, you used to ride a motorcycle. We car drivers KNOW that motoring laws don't apply to motorcyclists. When did YOU ever stick to the speed limits???
Ian. ;*)

PS
I think that the UK motorway limit should generally be 80mph (but rigourously enforced) but, in built-up areas, as low as 10mph where conditions call for it. Unfortunately, in the UK it is very difficult to put in place a limit of less than 30mph (I think it takes an Act of Parliament, or even an Act of God).

The PTC-II Xon/Xoff does work - or did in earlier firmware versions (I can't say that I've actually checked it recently). I think hardware handshaking is easier to implement though.

Well think of the logistics. The average officer gives out what 10 tickets a day around 75$ a pop. 750$. Now his salary is 240$ a day. He will probably pay 50$ in gas for the touring he does. Administration as well is probably another 100$. So figure after all that he clears 350$. That is being very generous. In bumwad idaho (not an insult just my way of saying nowhere) they proably have 2 cops out per day and chances are they will split those 10 tickets between the two since population is small.   Now the police pay 800$ a day for that 750$ income from tickets ... tell me where that makes sense that they do it for the profit ?

Tell me how its a bad law ? People speed, simple physics will tell you that that increases kinetic energy and momentum thus increasing stopping distances. People already don't leave enough room at the slower speeds and keep the same distances at the faster ones. So not only were they doomed from the start before they started speeding since every accident that could happen with buddy in front would result in them being involved, but, now their stopping distances are even greater and they will impact with a higher velocity.

First off its law. You hams don't like those cb'ers breaking the law
because of some little arbitrary thing like needing a licence to operate
(having the sheet of paper does not make you a better op) but yet you find
the "arbitrary" speed laws rediculous? They are there to lower the risk of
accidents. Car's do not handle as well at the higher velocities, reaction
times are required to be far faster etc etc etc ... They do have engineers
and such who do determine hte maximum velocity that is safe on a particular
road given its conditions or give it the max of 55 (its 65 now isnt it ?)
since that is about what the average driver can safely handle.

Probably the same common, everyday people that recognized a BAD
presidential candidate and voted him into office - twice.

It is bad law because people do not want the government
telling them how to live their lives and to what degree of
risk they can/should afford themselves. No one is mandated
to drive 70 MPH. If you don't want to drive a that speed,
then don't.

>People already don't leave enough room at the slower speeds and

Sign up with the Naderites then and push for a rollback
of highway speeds if you feel so strongly about it.

Cheers,
Bill K2UNK

If you mean Clinton, you sure have that wrong.  The safety nazis
love Cintonites because they all want to tell you and me how
we should live our lives.

Cheers,
Bill K2UNK

They were engineered for 70 when cars of far less technological
ability as to road handling were the norm. I-70 across Kansas
could easily sustain speeds well over 70 today even though the

road itself was engineered years ago.

>Problem is with fuel
>economy,

Fuel economy is an issue that impacts only ME. It is
none of the gov'ts business if I drive in a manner that
costs me fuel economy.

>doing away with frames,

Actually, todays "frameless" cars are better than those with frames in
the same accident.

>lawyers and millions of idiots who
>can't control there machine at speed.

Few speeding accidents ever involve other cars. Most
accidents are caused by non-speeding factors (alcohol,
reckless driving, etc.).

Cheers,
Bill K2UNK

More that they are there to garner revenue.

>Car's do not handle as well at the higher velocities, reaction
>times are required to be far faster etc etc etc ...

If YOU can't handle it, then don't.  No one is forcing anyone to
drive 70.

>They do have engineers
>and such who do determine hte maximum velocity that is safe on a particular
>road given its conditions or give it the max of 55

Nope, the national 55 in effect for some 15 years had NOTHING to do
with safety when imposed.  Since it has been lifted, highway detaths
per year are STILL dropping.

>(its 65 now isnt it ?)
```

>since that is about what the average driver can safely handle.

Many states it is now 70 or even 75. In NJ people routinely
drive 70-75 everywhere on the highway...totally ignoring
the posted 55 or 65 limits.

Cheers,
Bill K2UNK

There is ONE piece of PSK31 and Logging software...

http://www.qsl.net/kc4elo

Logger and Zakanaka

Everything Else is just 300bps packet radio wanna be's...

That's too pieces..

I use Digipan and VQLog. There's no interface between them. I don't mind.

Has anyone had any luck transmitting 9600 bps packet using an external
TNC with the Kenwood TM-D700A?

The internal TNC works okay at 9600 (although it's a little slow), but
using the external TNC connector it doesn't pass the 4800 Hz Kantronics
test tone at all. No support from Kenwood.

I was hoping to run both 9600 & 1200 together (which the internal TNC
won't do) and would really like the TNC to stay in the KISS mode through
a power cycle. (Running Linux AX25 TCP/IP packet drivers.)

[posted and mailed]

Hi folks!

I am just trying to set up an Linux (RedHat 6.2) to functiun
as an AX25(TCP/IP) gate way over the soundcard modem.
I have an SoundBlaster 16 sound card, so there is no problem I hope?
The computer is an old 486DX50 with 32M of RAM 2G om HD

The rest of the computer is working fine, so far.

Next step is to compile an new core with AX25, right?

And next step will be?

Please, I ned litle help here. I fel lost!

Hi

Have in mind that this Kenwood and also the V7 need very high modulation output.
So set the Kantronics jumper to high output voltage and will work fine.
Don't forget of course to set from menu 1-9-6 the dataspeed to 9600.

Yup.

> And next step will be?

go to radio.linux.org.au and fine ax25-apps, ax25-tools
and libax25.   Download and compile those. Install them.

Setup your config files. I think axports is the important one.

type 'call (another callsign)' and see if it works. Or at least see if the transmit light starts blinking. Check the input volume levels for the sound card, and which ports are turned on. (I use an SB Pro. THis is a little funky as I remember it, but I don't remember exactly how I solved it. I think I just hooked into the mic in jack rather than line in and it worked.)

I might be missing a step or two, but that's the main stuff.

I recently dug out the old KPC and installed WinFBB 7.00E & BPQ 4.08a so I could bring back my old BBS to the users who are without a full service BBS in my area. My problem is this:

After about 10 minutes of operation, the packets that are Tx'd by me, get too fast I.E A BBS id from me that usually lasts 2 seconds (1200) now last 1/2 second....Any suggestions?
I have tried everything from adjusting BPQ to re-installing WinFbb...I've never had this problem before so any help would be greatly appreciated...

Also, since there are no other bbs' around for forwarding on 2 meters, is there a way I can setup an internet forward via email importing messages or are there any Sysops who can give me an idea of what options there are for me?

Thanks Greatly...

Chris KK5IL

Subject: 2m transceiver for packet - recommendations please
Message-ID: <20010424083956.21547.00000748@ng-ck1.aol.com>
Xref: newsfeed.google.com rec.radio.amateur.digital.misc:2431

I use the local Packet BBS from time-to-time and also the DX cluster. To avoid tying up my main 2m/70cm transceiver I'd like to get a small transceiver for 2m which I can leave on for long periods.

Can anyone please recommend a rig for this purpose. I want to buy new probably and don't have time (or the will!) to modify old gear - even though that is probably the most cost-effective solution.

Thanks.

Allan

For 1200 bps packet any FM rig will do. Check around with local hams or
at swap fest. I used a Icom 2A for seven years straight on 2m packet with
no problems.

Just about anything except radios that have an auto shut down if left idle
```

if you are going to leave it unattended, otherwise you should be able to
use anything. I have got an old H/H here that needs a really long
TXDelay (>600ms). That's not real good, but it did work.

I prefer 828s for packet (I've got three of them running here on packet).
No mods needed, just a set of crystals and a quick tune up for 2M.
You know no matter what, the rig is going to be where you left.
No flat mem backup batteries or glitched CPUs to worry about.
But you can't hop around the packet frequencies if you have a number
of them in your area.

I ran an FT-227R on packet for years. Good little mobile rig that you
can hardwire to start up on any frequency (like your favourite packet one).
They are getting on a bit, but worth a look if you know someone who
is selling one.

The older Icoms and Kenwoods are very good, e.g. TR-7930/TR-7950.
I have had a 7950 on air 24/7 since about 1986 with zero problems.

IC-2100 is pretty inexpensive right now, and is a good packet rig.

My experience with the IC-2000, the predecessor to the IC-2100, easily backs up the notion this is a good 2m rig.

Hey Hank, any good tips on '99 Oregon Pinot Noir? Had a lovely visit to the Lazy Creek Winery in the Anderson Valley this last Sunday... and came home with a half-case of the superb '99 PN. I know it's a long way from Oregon...

I'm trying to persaude an old PC in the office to act as a Packet Node.

It's got a genuine SB-16 card installed, which works with the sound
driver in the kernel. However with the soundmodem I can't get anything
working!

Card is a SB16 (genuine) and using modules sb,uart401,sounds,soundcore
and soundlow it enits sound when I cat a random file to /dev/audio.
I can remove these modules and install the soundmodem driver fine,
but I'm having trouble with sethdlc of the following form:

Kernel version in use is 2.2.17. Following the instructions in the
kernel tree documentation I proceed thus:

```
% insmod soundcore
% insmod soundlow
% insmod sound
% insmod uart401
% insmod sb io=0x220 irq=7 dma=1
% rmmod sb
% rmmod uart401
% rmmod sound
% insmod soundmodem mode="sbc:fsk9600" iobase=0x220 irq=7 dma=1
% sethdlc -i sm0 -p mode "sbc:fsk9600" io 0x220 irq 7 dma 1
```

```
sethdlc: Version 0.5; (C) 1996-1997 Thomas Sailer HB9JNX/AE4WA
driver name: soundmodem
current parameters: mode <unspec>:<unspec>,<unspec> io 0x220 irq 7 dma 1 dma2 4
294967295 serio 0x0 pario 0x0 midiio 0x0
ioctl (HDLCDRVCTL_SETMODE): invalid argument
driver supported modes: <junk>
```

Any ideas what I could be doing wrong?   It seemed much easier
getting going on RTTY with a Creed 7E teleprinter!

My only quibble with the 2100 is that it is somewhat prone to
intermod problems if you have very strong local signals.

Also the IC-37 / IC-38 series of rigs are excellent for packet.

Have not made it out to the wineries recently, so have not tasted
much of the new Pinot. A few bottles via my favorite store, but
so far nothing that seemed unusually good. Been kinda busy,
and with slightly reduced budget have stayed away from the
expensive wines (darn ...). The budget problem will fix itself in
a month or so. Had a heat pump fail ... darn expensive.

```

Hmm, my sethdlc lines looks like

```
sethdlc -p -i sm0 mode sbc:afsk1200 io 0x220 irq 5 dma 1 pario 0x378
sethdlc -i sm0 -a txd 200 slot 10 ppersist 255 half
ifconfig sm0 hw ax25 ax25 KE6I-1 up
```

Also, I think you can't use the linux sound drivers and the kernel soundmodem at the same time.

There's a new soundmodem driver, which I just downloaded, and am looking at now at...

http://www.baycom.org/~tom/ham/soundmodem/

This one runs off the OSS sound drivers, rather than accessing the hardware directly. Though I'm just poking around now. I haven't hooked it all up.

Hi,

I was wondering what the best system would be for a portable packet
satelite system.
I was looking at the TH-D7A(G). I know there is different packet modes.
What ones would the TH-D7A work with or isn't it good for that type of
operation?
Maybe buying a regualer HT and adding an external TNC would be better?

It would have to be portable. Like not needing big batteries etc.

I would appreciate the advice, comments, etc.

I use the TH-D7A(G) for satellite use. You can hang an amplifier on it if you are trying to work a week signal satellite. I have successfully used it to talk through SUNSAT (now defunct) and the ISS (APRS mode). APRSDos supports automatically tuning the D7 to the right frequency for the satellite and setting the mode to the proper operation (packet or voice). For the money, I would use get the D7. Plus, it is very easy to add a cheap GPS and use it for APRS when you are not working satellites. It also makes a great dual band hand-held (not all the features I would like, but most of them). I have even used it on trips to Europe.

73,

Thanks Pete,

So when a satellite sais FM PSK or FSK what one can the TH-D7 do?
I see PSK and FSK what is the difference? I know one is Phase Shift Keying and Frequency Shift Keying does the TNC do these?
I think that it can only do FSK :) but then again i'm just new so what do i know.

I'm taking it that this is a list of some of the satellites it can do?

SO35 145.825 436.290 8 9600 baud FSK
UO22 435.120 145.900 3 9600 baud FSK
KO23 435.170 145.900 4 9600 baud FSK
KO25 436.500 145.980 3 9600 baud FSK
TO31 436.925 145.925 5 9600 baud FSK

Thanks

I believe 9600 is FSK. I haven't done much pacsat work and the manual is a
little vague about 9600 operation. The spec says the system does F1D
(GMSK), F2D (FSK), and F3E(FM). I don't remember if GMSK is the 9600 mode
or not (1200 is FSK). You might check Bob Bruninga's (WB4APR) site at
http://web.usna.navy.mil/~bruninga/astars.html for more info.

I take this to mean that the TH-D7A(G) can do 9600 baud FSK for APRS. So does that mean the TNC can do that?

<from http://web.usna.navy.mil/~bruninga/astars.html>
9600 BAUD ASTARS became a reality when Kenwood introduced the 1200/9600 baud APRS data mobile radio, the TM-D700A and now the TH-D7(G) Handheld. These dual band data radios with built-in TNC's and front panel APRS displays make it possible to send and receive the very short APRS style comunications via any 9600 Baud PACSAT if digipeat is enabled. Unlike the 1200 baud PSK PACSATS, the 9600 baud PACSATS use FM radios and FSK. Thus, the these two radios are off-the-shelf satellite data terminals ready for ASTARS and they need NO PC or other accessory. They can send and receive all data on the radio front panel with only the proper mobile whip antenna! (see below).

See my sig for the web site. The latest full installation version is
6.51, and there's a minor update to 6.52 available.

Thanks Roger. I had your old web address -- http://www.peaksys.demon.co.uk/index.htm.

I am hoping to try your program with my SCS PTC II. The SCS PTC II implements the WA8DED host mode but I think you must send some commands to the SCS PTC II to put the SCS PTC II into the WA8DED host mode.

Is there a way to send some commands to the SCS PTC II on start up of Winpack?

I think Winpack supports multiple packet connections (or streams) when using the WA8DED host mode.

The SCS PTC II is also a little strange. To my knowledge, it is ONE of the VERY FEW TNC's that does not support ANY flow control between the computer and the SCS PTC II. No Hardware or XON/XOFF software flow control. Perhaps the WA8DED host mode provides some sort of flow control to prevent overflow of the receive or transmit buffers.

Will Winpack work with the SCS PTC II? What setting in Winpak do I use -- the TF2.7b or TFEMU?

```
73's
Rob

P.S.  I hope one day you consider adding support for the KANTRONICS HOST
mode in Winpack.  I am sure that there would be lots of users of KANTRONICS
TNC's that would love to see that.

I have a PTC-IIe here, but I haven't yet looked at how well (or not) it works with WinPack. It's on my "to do" list. I recently added support for it to UI-View32, and the only differences compared to true WA8DED host mode were in the initialisation. I'll try and get round to supporting it in WinPack within the next month or so.

Of course the PTC-II is rather more complicated than the PTC-IIe because it has more than one port, and the host mode protocol has significant differences compared to DED.

>The SCS PTC II is also a little strange. To my knowledge, it is ONE of the

In DED host mode, the TNC only sends data to the PC when you poll it. With outgoing data, you can check how many frames are queued in the TNC.

Thanks for the reply. I think you will like the PTC IIe on H.F.. It is a
great modem. But there is VERY little software out there for the PTC II
that supports the PTC II's modified WA8DED host mode. I hope you get some
time to try out WinPack with the PTC II(e). It would be great to be able to
use BOTH packet ports in the PTC II with Winpack (but if you only implement
one port I will understand)

Did you add support for the PTC II as well as the PTC IIe to UIVIEW32?

Rob

Yes, and it supports both packet ports.

Hi Roger,

I just went to the UIVIEW32 site. I see you have made lots of improvements
to UIVIEW and UIVIEW32! Both support KISS modems.

Since many HAM's in North America have packet AEA or KANTRONICS TNC's (which
have their own host modes as well as KISS), you may want to consider adding
support for KISS modems to Winpack. I know you could use AEA and KANTRONICS
modems with Winpack using the terminal mode but that mode does not allow you
to have multiple packet connections.

Just a thought. Keep up the great work! I am sure that there are many Hams
like me who appreciate it!

73's
Rob

Just purchased an SB-201 and was wondering how to make sure I don't damage the tubes when using some of the continous digital modes such as PSK31 or RTTY. I have a Kenwood TS-820S which can drive ~150 watts into the SB-201 - what is a safe input power for the Heathkit amp for continous output? The manual doesn't give any suggestions. Thanks.

Safe 'rule of thumb' would be 50%. Take a key down plate reading, or wattmeter reading in SSB mode. Cut it in half by reducing he DRIVE from the EXCITER.

BTW the 820 will be a world class pain in ur butt for PSK31 work. Not stable enough.

But try it anyway, have fun.

Thanks for the reply - hadn't considered that it would not be stable
enough - no loss if it doesn't work well for PSK31 - I've had the radio for
22+ years.  To make sure I understand, I should back the exciter down to 50%
of its full output power - yes?

Do NOT consider using an amplifier for PSK31!!!!!!!
Most signals NOW are over driven at 100 watts!
It's aQRP mode!

Just tune it up normal. Assuming your using AFSK for the RTTY...just turn down the microphone till you see half power.

I normally run about 20 watts of exciter to the Ameritron 811H. That gets me basically half power out of the Amp.

On TTY you will need a amp some times. On PSK no need at all. But stability is required.

Dan/W4NTI

I wouldn't call it a 'QRP' mode Tom. It works well with QRP, but it all started running around 50 watts. And that is where most of it still is.

Um ... modes are not QRP ... just some hams like to run QRP.

Try running PSK31 across a weak ionoscatter link, and you
will need all the ERP you can muster.

Sometimes you need a lot of ERP to get the S/N you require.

Hi all,

I'm planning an extended coastal cruise in the SE U.S., and would like to have internet email access from the boat. Can someone suggest links where I might learn more about how to do this? I am hoping that I'll be able to do it on 2M or 440 MHz. I know about the hf pactor links, and will do it that way if I can't do it on VHF.

I'm planning on purchasing an ICOM IC-207H for this purpose. Any reason not to? Any other radio that might be a better choice?

Is web access available? I realize that it would be a bit slow at 9600.

tia,
KG0T

You're dreaming! :-)

I don't think you'll find much 9600 baud activity Captain.
I would plan a system of port calls, or relay via voice on VHF,
to Hams willing to send messages for you.

Do you have a list of nodes you are going to use, or do you
just assume they exist? By that, I mean you may want to do
some research in that area of the planned trip.

Yes, you can easily send Internet EMAIL using packet. You need to connect to one of the packet to Internet gateway packet stations (many of which use NOS).

Once you are connected to a NOS station, you can telnet to one of the NOS stations to which you have told your friends to send email (e.g. telnet n8da.ampr.org). Once you are connected you can retrieve your EMAIL and send some. (In this example, tell your friends to send EMAIL to yourcall@n8da.ampr.org). But only send PLAIN text messages!

In the US, there is not much 9600 baud packet activity. Most is still 1200 baud. (the US is far behind Europe in this regard).

But if you are just sending and receiving EMAIL,speed is not a big factor. (You need speed for graphics and binary files).

But VHF has limited range. You will need to get a list of NOS stations and their frequencies. If you are near a major city, you should find a NOS station. In the country is a different story.

A more reliable, robust and faster system would be to use a HF radio and a pactor modem to connect to a WINLINK station. The best pactor modems are SCS PTC II or PTC IIe which implement Pactor II but they are pricey. But you can get a low cost second hand Pactor 1 modem like the PK232 off EBAY. The Winlink MBO system was designed for Marine operators. You dont have to wait to be in range of a NOS station to use Winlink for EMAIL!

Good luck

Rob

CSS and N6TR begin discussions on Windows(tm) based contesting software.

Program would use TR and Log Windows technology for ease of use and powerful features.

Muscle Shoals, Alabama. 1 May 2001: Creative Services Software announced today they have entered into discussions with Larry (Tree) Tyree, N6TR to research the feasibility of incorporating both TR Log and Log Windows technology into a next generation contesting program.

"Looking into the future, we're seeing more and more hams getting into contesting.", said Rick Ruhl, W4PC, President of Creative Services Software, Inc. "Using the 'best of' technology from TR Log and Log Windows, it's a good base for a next generation contesting program with hooks inot our logging program for keeping track of awards and contacts."

"Partnering with Log Windows will allow the TR Log concept to become available in the windows environment." said Larry "Tree" Tyree, N6TR, owner of TR Log.

The DOS version of TR Log will still be sold by N6TR and the current distributors. The windows version will be developed, sold, and supported by CSS and its dealer network.

Hams use TR Log and Log Windows worldwide.

Log Windows is owned by SCO, Inc and is maintained by Creative Services Software.

Creative Services Software is at http://www.cssincorp.com
TR Log is at http://www.qth.com/tr
The Log Windows home page is at http://www.logwindows.com

Windows is a Registered Trademark of Microsoft Corperation

Questions and Answers about the CSS and N6TR press release:

Q: Does this mean that the DOS version of TR Log is dead?

A: No. The DOS version of TR Log will continue to be updated and enhanced just as it would have without this agreement. TR Log for DOS would only die if everyone decided the windows version was preferred.

Q: Will Creative Services Software take over the DOS version of TR Log as well?

A: No. The DOS version of TR Log continues to be owned by N6TR.

Q: How can I upgrade to new windows version?

A: Details still need to be worked out (after all, we don't have any software yet). The Windows based contesting module will be a separate program from Log Windows (you don't need Log Windows to run the program). The contesting module will interface with Log Windows to allow full data exportation.

Q: Will future TR Log DOS features be exported to the windows version? How about the other way around?

A: Some features (such as support for new contests) can move very easily from one program to the other. Other features will be more difficult. Essentially, they will be separate programs after the initial development.

Q: Who do I call for support of the windows version?

A: CSS will be supporting the program. There will likely be a separate mail list generated for the windows version, which can be used to ask questions.

Q: Does this announcement explain why TR Log wasn't at Dayton this year?

A: No. K5TR and N6TR previously announced their intention to take a year off from Dayton last August.

Q: Will there be any changes in the distribution of TR Log?

A: None are planned at this time. The TR Log distributors will continue to sell and support the DOS version. CSS will market and support the windows version.

```

I saw it in QST and I understand it will be debuted in Dayton.

It uses DSP modems and INCLUDES PSK31! Any new modes "should" be able to be simulated via software.

You can upload new modes via the serial ports with software you download off of the Internet.

The NEW KAM will be a true dual port machine like the KAM+. The KAM 98 is only a single port TNC.

Anyway! It is way cool! Just thought you would like to know!

Dino

I am posting here because of some of the nasty things I have read in this group and in QRZ discussions regarding freebanders. We who use the frequencies from 27.405 to 28.000 have more in common with hams than you might think. We are good operators and have knowledge of propagation and skip conditions. We use Yasus, Kenwoods and Icomm radios just like you do, so we know technical issues as well or better. However, the attitude of some hams toward us is rude and condescending. We are treated like 2nd class citizens. This should not be. We have the same rights under the constitution as legal hams do. For those that do not wish to be under Uncle Sam's thumb, freebanding is a viable alternative to getting a ham radio license. What I am saying is that maybe the next time you meet a freebander it might be wise to talk with him before you condemn him.

This article ought to clarify things, as I am the author: http://sporadic1.tripod.com/page7.html

I am QRT and standing by. (No flames answered. Please reply via email)

Hams break the law?
That seems the main "feature" of "freebanders".

> We are good operators and have knowledge of propagation and skip conditions.

Good operators follow the regulations of their country.

Yup. But there is that little thing about breaking the law ...

I have an idea what it is ,but not really
I know its measured in db's but I could never realize what that meant.
as easily as selectivity "the bandwidth of that filter is 2.5 khz"
or sensitivity "that receiver can really pull stations out of the noise!"

Please explain "dynamic range"

thanks

Worse yet. Another freebander, trying to justify his existence on the
band,
has cross posted the same tripe. Just a bunch of trolls. Hopefully, most
people will just ignore them and they will go away.

SCS just announced a new version! .... PTC II Pro.
http://www.scs-ptc.com/features.html

 ... and right after I bought my PTC II ! It only has one or two additional
features, so I suspect there is not alot to gain in upgrading at this point.

Xref: newsfeed.google.com rec.radio.amateur.digital.misc:2486

Hi Bantam -- without the math

"Dynamic range is expressed in dB where the lower limit is the smallest discernable signal (receiver noise floor) and the upper limit is the point where intermodulation products become noticeable. It is an important specification as it gives a figure of merit for evaluating the strong signal handling characteristics of a receiver. Values of 103 dB are typical. The use of front-end attenuation and an AIP circuit can help reduce the effects of intermodulation. The receiver noise floor can be affected by receivers using synthesized tuning schemes. This has improved considerably with the new transceiver designs.

In practical terms, dynamic range is the ability to hear weak stations between nearby loud stations. Another measurement of this is blocking dynamic range, which is the difference between the receiver's noise floor and a signal which causes one dB of receiver gain compression (i.e., non-linearity). This marks the point where receiver de-sensitivity begins.

Intermodulation distortion dynamic range is the difference between the receiver's noise floor and two equal received signals which produce distortion three dB above the noise floor. This marks the point where undesirable spurious signals are generated in the receiver.

Nothing is more disconcerting than to be in a contest or pileup environment and have a receiver that can�t handle the huge signals and the weak ones adequately, this coupled with poor selectivity is a lose-lose proposition."

Hope this helps

And deservedly so. As someone else pointed out, "legal hams" operate where their licenses permit them to do so. "Freebanders" operate where no one is permitted to operate. Just what sort of attitude should a law-abiding group present to a collection of outlaws; praise? You're treated "like [second] class citizens" just like any other outlaw or convict because of YOUR OWN ACTIONS.

I have heard that finally someonw has produced software
that permits PACTOR using sound card only without benefit
of TNC of any kind.   Pactor of course would insure the
integrity of traffic from origin to destination via CRC
principles.   Any comments will be appreciated on this
subject.   I know about psk31, but its non error correcting
lameness is its biggest fault.

There once was a DOS program that did Pactor-I ARQ. It looked rather
messy to me in that you had to calibrate it to the clock in the PC.
MixW will receive Pactor-I but not transmit. The timing requirements
for ARQ modes are rather critical for a Windows environment. I doubt
that it is likely to change any time soon.

It's possible, but not enough interest.  Hams won't buy it,
so hardware designs are the only way to make a profit.

I am looking for suggestions for a TNC that is aprs ready. Basically I would like to hook up a GPS receiver to the TNC and not use a computer after the inital setup. Its intended use is for backpack operation (to report position) and maybe even a digi (if needed). I have read that vendors are putting smarter and smarter TNC's out on the market and I really have not kept up to what's current. Of course, the lower the power requirements the better for the TNC.

73,

Tony N8XJA

```

Your statement is unoriginal and weak.

So, you base your respect for people on whether or not they follow the laws that your local, state and federal government imposes on them?

Let me ask you this then, if you were around during prohibition (were you?), would you have disrespected bootleggers and consumers of alcoholic beverages up until the very point where the 18th amendment was repealed?

Good thing all those amendments came along abolishing slavery and granting women the right to vote or you still wouldn't have respect for women or Negroes.

Well, just take a look at Bill Clinton ....

>Let me ask you this then, if you were around during prohibition (were you?),
>would you have disrespected bootleggers and consumers of alcoholic beverages
>up until the very point where the 18th amendment was repealed?

Probably not. However I do respect the values of H.D.T. At least he broke the law for much better reasons than to get drunk or to make an easy buck.

>Good thing all those amendments came along abolishing slavery and granting
>women the right to vote or you still wouldn't have respect for women or
>Negroes.

You are way off base, here. Many people gave their lives in order to abolish slavery, and many of those that died weren't slaves. The right for women to vote wasn't granted because the government gave up chasing women out of the toll booths. These examples don't even compare to the actions of most radio pirates. There are right ways and wrong ways to change the law, but radio pirates don't even try.

In fact, freebanders do NOTHING to try and change the law except to whine about the FCC. I haven't seen anyone in rec.radio.cb, or anywhere else for that matter, make even a half-assed effort to try and change the laws regarding CB radio. That's because the collective mentality for freebanders is to "do what you want and fuck the law, at least until you get caught." They, like most criminals, want something for nothing at the expense of others. I'm sorry, Bob, but that just isn't an attitude that deserves ANY respect.

You don't need a TNC for that. Several solutions with small microcontrollers (PIC etc) are available that will do just that with much less components in a lot smaller package.

Hello All!

I want to get started in local packet on 2 meters, but don't want to spend too much money just trying it out. I was looking at both the BayPac BP-2 and the Rigblaster Nomic as an entry point. Both seem to get good reviews, but I was leaning towards the Nomic since it'll work with Win98 software (the Tigertronics BayPac website clearly states that the BayPac needs to work in DOS only mode). I'd like recommendations from all the packet Elmers out there on the merits/downfalls of each.

Thanks in advance!

73

It's a simple law that you choose to disobey, you obviously think yourself grandiose enough to decide which law should be followed and which shouldn't. If you choose to disobey those laws what about others?

>
> Let me ask you this then, if you were around during prohibition (were you?),

You are getting the idea ... why respect criminals ??? I'm pretty sure you don't go to local penn's to drop off stuff for the criminals inside (as you would call them ... "good buddy")

> Good thing all those amendments came along abolishing slavery and granting
> women the right to vote or you still wouldn't have respect for women or
> Negroes.

If a law is wrong lobby to change it ... don't sit back in your homes breaking it every chance you get ... and please don't ever compare yourself to women and african americans of back then ... you are not oppressed.

The test is a joke ... I did mine when I was 11 with a grand total of about 2 weeks of studying for it (on my own I might add) ... its 100 questions multiple choice (up here anyways) and is general knowledge any operator should know.

The only thing stopping you from operating legally on the ham bands is your ignorance and your spite for rules and regs.

You are implying that you have never driven above the speed limit, Rob.
Will you swear that you have never broken a traffic law? Have you never
gotten a traffic ticket or a parking ticket?

I have never received a speeding or any other traffic infraction. I have never received a warning. I never speed. I always use my turn signals/mirrors/shoulder check when turning and changing lanes. There is no need to. I always give myself ample time to get anywhere. I have never received a parking ticket either. Speeding is stupid AND illegal.

Consider the KANTRONICS KPC-3 Plus.  It has great APRS software including a
great UI DIGI software for APRS digipeating!

I disagree! There is definitely interest! But the big problem is trying to implement PACTOR 1 using a sound card under Windows!!

Most HAMS want a PACTOR 1 sound card program to run under windows so they can run their logging software etc. There is the BIG problem. It is VERY difficult to obtain accurate enough timing even if you use DIRECTX technology. The problem is with WINDOWS which was NEVER designed to be a real time Operating System.

ALL the Pactor 1 sound card programs that I am aware of run under DOS or Linux.

In my view, the BEST Pactor 1 sound card program is RITTY version 2.38 which runs under DOS. But you need a TRUE SoundBlaster ISA card (no Clones and NO PCI cards!). I understand that you can still buy RITTY version 2.38 from K6STI.

Tom Sailor (HB9JNX) has also written a Pactor 1 sound card program for DOS but it needs sound cards using PersonalSoundArchitecture (PSA) Chipset from Analog Devices, such as Echospeech Personal Sound System and others. The PSA chipset relives the main CPU of a lot of work. But you cant buy PSA chipset sound cards anymore. To bad since his Pactor 1 program is free.

If you have an old fashioned RTTY modem such as an AEA CP-1 you may want to try TERMAN93 for Pactor 1. It is free and from HB9JNX (see http://www.baycom.org/~tom/ham/ham.html)

I think most hams are looking for a VERY low cost way (Preferably free) to operate Pactor 1. To most Hams the sound card is the way to do this. If that is truly your motivation, then install Linux and run the FREE Pactor 1 sound card program. Otherwise, buy RITTY 2.38 (for TRUE ISA Sound Blaster cards) or buy a second hand PACTOR TNC such as a AEA PK-232 off Ebay).

Well it certainly is hard to find people with the courage of their own convictions today. The way I figure it, those laws are there for a reason. Who am I to contest them or break them. The way I look at it is a criminal is a criminal regardless of his crime. I can't stand criminals of any sort, so, why would I lump myself in the same group as them? As for speeding is concerned, I don't see a point to it. The farthest I go on a daily basis is 110kms. Speed limit's 80kmh ... if I tossed on say 15kmh to that (2 points off my licence if I get caught too) it will take me 1hr 9mins, if I do the speed limit it will take 1hr 23mins. 14 extra minutes is no big deal with me. And is certainly not worth the trouble if I get caught.

As for the signals and such, using them is very important, kind of a good idea to keep the other drivers on the road informed of my intentions.

Compared to the other BS on this rec.radio.amateur.policy
NG, this one is minor.

I don't know about that. I have been driving on the Los Angeles area
freeways and city streets for 32 years and I have never received a traffic
ticket either. I don't think this is as rare as you think - I know of
several other people who have also never been cited for a moving violation.

I have, however, received a parking ticket from a city that did not allow
overnight street parking in residential neighborhoods, and "forgot" to post
any warning signs. A new twist on the old "speed traps" ? :>)

Anyway, I challenged the citation on the basis of 1) the violation was not
done intentionally, and 2) the violation was a direct result of the city's
failure to post adequate signage informing the public of the ordinance. The
judge concurred and dismissed the citation.

Plus on a rather hedonistic point of view ... it annoys the hell out of those drivers who are in such a hurry to get nowhere as to risk their and others lives. I have to bring the camera one of these days to catch their expressions =)

The vast majority of speeders don't purchase and install special
equipment (linear amps) and modify their rigs (frequency mods) with
the sole intention of breaking the law.

My point exactly. 'Freebanding' is a deliberate act, carefully planned and executed. But just for the sake of argument, suppose you live on a street where the speed limit is posted at 4mph. How long until you get fed up with people cruising past your house at 1000mph? More realistically, your street is probably 25mph, and that would clock those speeders at 6250MPH!!!! Not just that, but these speeders hold drag races, don't use any mufflers, and drive off-road right through private property. When these speeders are caught, the fines are typically more than ten times that of speeders on the highway. So how do you compare radio pirates to speeding?

They both willfully break the law. They both know that they did it (although ignorance is no excuse), heck "freebanders" have a term for their crime, "freebanding". They use a portion of the spectra reserved for other services, which in turn can lead to prolonging those services and in the case of millitary and SAR that could mean someones life the same as doing +20% on the high way makes you more of a danger to other drivers.

> BTW, any relation to Bill St.Denis in Spokane?

Nope ... I'm a canuck.

The difference is that when you run a kilowatt amp, you do it with the
sole intent of breaking the law -- you purchased the amp in order to
break the law and nothing else. Not true with a car, unless your car
can only operate above the speed limit.

I agree with you there, as it is yet another reason against pirate
radio.

Both the Baypac and sound card interface approaches will work fine.

If you are using an old slow PC, use a Baycom modem or external TNC.

If you are running a fast Pentium class PC, go with a sound card approach. It is a lot cheaper.

If you want to save some money, build your own sound card interface and use AGW packet engine or Flexnet. It is easy to build a sound card interface. If you use Vox, all you need are couple of audio isolations transformers and a couple of resistors. Just put them inside a cable, add some solder and tape and you have a great interface with JUST as much isolation that you would get from RigBlaster! You don't even need an enclosure.

If you want to use PTT, add a transistor, a diode and a couple of resistors. (But you may want to add an enclosure). All the parts are available from radio shack.

Good luck.

Per the SCS web site, the reason given for the creation of the PTC-II Pro was
that the DSP chipset currently being used in the PTC-II was simply no longer
available... nothing said about a higher power DSP actually being necessary for
better performance (although I suppose it can't hurt). There is a TXCO
oscillator in the Pro, but since all Pactor II boxes automatically adjust for

minor freq variations between connected stations I'm not sure what the TXCO brings to the table. The only other significant item is the Pro coming with 2 mb RAM standard, but as far as I understand this only serves to increase message capacity of the internal mailbox - if you use it. So, it sounds like they threw in whatever incremental improvements they could since they had to update the design anyway... but not that there will be any actual link performance improvement with the Pro vs. the II or IIe. This is just what I surmise from what I have read, perhaps I am missing something... else it certainly doesn't seem worth upgrading if you already own one a II or IIe. But still nice to see the product line evolving... SCS makes a great line of hardware even if it isn't cheap.

Has anyone noticed the new 'Hayes compatible' mode that lets you use AT commands to establish links? Or the new PPP/TCP/IP functionality? Really neat. But you have to lay down another $89 for the professional ('Marine') software version. With the Marine software you can also establish links in 'robust connect' mode (vs. receive only with the 3.1 standard software). They will have my 89 bucks very soon.

I use my Palm Pro with an AOR tnc - works fine. You just have to get used
to the graphiti entry on the Palm and smaller text. I use a termal program
called PTELNET, but there are several others avaible.

Bob,

This is NOT true. READ the PTC II manual. 300 baud packet operation is possible with the PTC II. I have done it!! You need a program called TFX 2.8 available from www.nordlink.org. (Click on FIRMWARE even though TFX 2.8 really isn't firmware. It runs on your PC). You will also need a good terminal program that operates in the WA8DED hostmode. Many Hams use Grafik Packet available from http://www.higgy.de/fert_e.htm

The PTC II manual provides all the details to make 300 baud HF packet possible with the PTC II. (In fact the TFX 2.8 program does ALL the hard work. The PTC II just acts like a VERY simple modem).

BOTH of these programs are mentioned in the PTC II manual. It is TOO bad that SCS did not provide copies of these programs with the PTC II or even provide links to these sites from their web site.

Rob

Check EBAY. But once you have a PTC II, you don't want to give it up. It is a FANTASTIC modem! Pactor II is amazing. You won't see many in the used market. Maybe when SCS releases a NEWER modem, you will see some PTC II's on the used market.

Rob, I see that you are correct in that the newer firmware versions in the PTC-II permit it to act as a simple modem. The packet software runs on the PC. I was thinking in terms of it running stand alone with the mailbox like it does with the packet modules and Pactor.

Hi Ron and the group!

After releasing the new PTC-IIpro I think several ham's will upgrade from
PTC-II or PTC-IIe. So I think there will some PTC's be available in the near
future.

Drop the NOS program, if you are interested in packet message forwarding. The BBS code in xNOS is a third-rate hack. It can be said to "work", after a fashion... It just doesn't work very well. You'll hear from several xNOS buffs about how wonderful it is, but these folks generally have no idea what a decent BBS is or what one should act like. All they know is xNOS.

Running xNOS as if it were a real BBS tends to cause problems... Then, you find yourself having trouble getting anyone to forward with you.

Try "FBB" or "G1NNA" if you want an actual BBS program. xNOS is for tinkerers who think of systems that constantly have to be tweaked and fixed as "advanced".

Get a real BBS program if you want to forward BBS messages, and run xNOS (if you just HAVE to) in another machine where it will not interefere with your more serious software. Takes up valuable memory and hard-drive space..

I'd be particularly interested in KISS mode stuff,
since I was planning on building the packet modem
from QST anyway.

Yes, I get the same thing with Netscape 4.72 on a Ultra 450 running
```

Solaris 2.6. However, the site works fine on an older version of Netscape, 3.01, running on a 670MP running SunOS 4.1.4.

It turns out that there is a "meta" statement on line 3 of the html code that makes Netscape 4.72 go crazy:

```
<meta http-equiv="Content-Type" content="text/html;
charset=windows-1257">
```

If you remove the end of this statment so that it reads:

```
<meta http-equiv="Content-Type" content="text/html">
```

the page works fine with Netscape 4.72. The earlier versions of Netscape must ignore the bad line.

Martin

We've moved to a new website. All you want to know about the book
"NOSintro -- TCP/IP over Packet Radio" is now at:

   http://www.ian.wade.care4free.net/nosintro.htm

All about how to configure and run TCP/IP under KA9Q NOS, plus
interfacing to NET/ROM and legacy BBS networks.

Large extracts from the book are on the site.

It is not a bad line, it is a specification of a character set that you
apparently don't have installed on the computer. That very early version
of Netscape probably does not support the notion of character sets and just
ignores it.

The behaviour of showing any unknown character as a ? is bad in this case,
but the browser does not know what kind of character set it really is.
Just mapping everything 1:1 into iso-8859-1 characters apparently works in
this case, but in other cases would have resulted in junk that is just as
unreadable (try it on a Japanese page).

As Unix/Linux users know, most windows users don't even realize they are
publishing information in a character set that is unique to their region
and even their system. Anything typed in a US version of M$ Word and then
published on the Web is in the windows-1252 character set that sort of
resembles iso-8859-1, but differs in the usual M$ "embrace and extend"
ways. When a Word user types a ", he gets what M$ calls "a smart quote"
and what others (on non-Windows systems) see as a question mark.
That really makes it look like a dumb quote.

Rob

Which raises a good question... what does the PTC-IIpro add that would make one want to upgrade? I see a faster processor and a TXCO timebase, but will these really make a significant difference in on-the-air performance? Also some minor upgrades, such as a built-in audio amp and more memory (for the internal mailbox?). Nice to have I suppose, but enough to justify the cost of upgrading..? Seems like more of an incremental hardware upgrade than anything else.

Is anybody else running the "user port" option on their FlexDigi nodes in the US? This option activates a TXDELAY sniffer. If a connectee has 100ms or more TXDELAY than his radio needs, the node sends them a short message and disconnects them.

Sounds unfriendly, but it's really a case of "tough love"... We enabled "user port" on a FlexDigi here, and it didn't take long for the local packet ops to discover that the default 300ms TXD in their TNC's is generally twice as long as it needs to be. Most of us run 100-150ms TXD now, depending on what our radio will handle.

The TXD sniffer doesn't measure the over-all TXD, only the extra that your radio does not need, so if your old rig really does need 300+ms TXD, the digi will allow it.

An average 150-200ms difference per transmission doesn't sound like much, but strangely enough the difference is very noticable on the air. It adds up. Things got "snappier" as the members of the LAN adjusted their software in order to access the node. No complaints either, which was a real surprise.

In short, one or two character transmissions (commands to a node, cluster, BBS or mailbox) the old 300ms TXD was actually longer than the packets. Maybe thats why the difference is so easy to notice. Also, the "turn around time" between longer transmissions was reduced noticably.

I've heard that other US FlexDigi SYSOPs who tried the "user port" option were flooded with complaints... It didn't happen here, though.

Anybody else tried this? If so, how did it go? The response here was so good that we are seriously thinking of introducing DAMA access. The local Hams here in south Texas have demonstrated a willingness to try new ways of doing things in order to enjoy better performance. Most of our nodes here are 800-1000 ft. up, so HTS is a real problem. DAMA will effectively eliminate that, speeding things up a bit more and letting Hams run directional antennas (yagis) along with the minimum power needed to access the node.

That stuff about everybody in the LAN needing to run omnidirectional antennas and high power in order to be heard by every other station in the LAN is pretty silly, and it will be great to get away from it for good.

Anybody in the US using DAMA? If not, why not?

Good explanation.
The page was displayed correctly under Microsoft Explorer on my HP
laptop.

My version of NET also has it. But not the "disconnect" stuff.
When connected to the node one can ask for a list of measured TXD figures (as you say, only the extra txd above the required minimum), like this:

```
txd lap48
UTR:PI1RNI} TXDELAY on lap48:
Callsign  TXD(ms)  Mdev  Samples
PE1CHL         73     0     2069

```

As you can see, the 300 ms syndrome is present here too. Unbelievable how many stations are running 9600 bps with apparently 300 ms TXD where 50-100 would be enough.
The Mdev (mean deviation) figure shows the variation in measured txdelay. Sometimes this figure is high, because the transceiver shows a variable time to lock on, or the txdelay generated by the software varies by +/1 one timer tick. That can be as much as 55ms in some software.

Rob

Ok, after realizing that Netscape had a problem with character sets I go
with IE to get the pascal compiler.
I go through the questionier and get to the actual download zip file.
However, attempting to get it results in a "invalid link error".

Has anybody successfully downloaded it?

Has one out there found how to set up the DR-135TP, with the APRS program 2.4.6 yet. Or were I could find out about it.

That (your software's TXD display) looks very good.

You might consider putting the "warning and disconnect" in there as an option. It sure eliminated the problem in a hurry here. If you run a lot of extra TXD, you just don't play. I was told to expect a lot of complaints, and fully expected them. It seems like a reasonable thing to expect... - But the complaints never materialized, perhaps because they had to adjust their TXD anyway in order to complain, and by then they had a chance to see the difference it makes for themselves and lost the desire to fuss about it.

I get the impression that modernizing things is much more of a struggle here in the US than it has been across the pond. I'm glad it's that way for you folks, and am doing what I can to bring a little bit of that over here.

Notice how I got no replies whatsoever from here in the US? Oh, well; You can't drink a quart of tequila in one big swallow, but must do for it one gulp at a time.

Well, the above feature has been in the software since 1995, according to this entry in the change history:

PE1CHL.950819:

TXDELAY measurement added to SCC driver. For the first packet in a
transmission, the time between "DCD on" and the start of the packet is
measured, and an average value is kept for a number of callsigns on
each interface.
The command "ax25 txdelay <iface> <numtxdelay>" specifies the number of
callsigns to keep for each interface, default is 0.
Example: ax25 txdelay lap48 23
Using "ax25 txdelay <iface>" a list is displayed, specifying the
measured txdelay, the mean deviation on the measurement, and the number
of measurements (samples) that have been made for each callsign.
The command TXDELAY in the NET/ROM also displays this list.
Stations can optimize their TXDELAY setting by aiming for some low value
of measured TXDELAY, e.g. 50 ms. After a change, a number of
transmissions should be made to allow the average to be updated. When
the "Mdev" has a low value, the measured TXDELAY value should be OK.
Note that for some modems it may not be possible to get a low value,
because they give DCD before they are actually ready to demodulate data.

I wasn't the inventor of this, I think either Flexnet or Thenet had it even before that date.

I considered adding a feature to report bad txdelay to users, but I am opposed to sending warning messages in-band in a connection, as connections are often used by automated systems which would not understand such warnings and would misbehave (e.g. corrupt forwarded bulletins, automatically re-connect immediately after such a message, etc). Warnings would also have to consider the next level transport protocol (here it often is TCP/IP) and the correct party to send the warning to (e.g. when a station is worked via a digipeater, the actual guilty party is the digipeater, not the connecting station).

Much more complicated than one would think at first glance. Ignorance about problems like this has already lead to a lot of crap in packet radio programs (like the "Reconnected to XYZ" when the endpoint of a link via a node disconnects). Many people don't understand connection transparency.

So I considered it better not to try this. When the measurement feature was incorporated, I have spread a few messages to bring it to people's attention and tell them what to do to optimize their station. But of course that is 6 years ago and the problem just slowly returns because people don't know or don't care...

>I get the impression that modernizing things is much more of a struggle here
>in the US than it has been across the pond. I'm glad it's that way for you

Well, while the impression from discussions I see over here certainly is that the packet network has been much more advanced over here than it is in the USA (both in software development and in actual deployment of faster radio hardware), that situation may be quickly equalizing because of the rapid decay occurring in the past months. The network is falling apart because some things break, sysops of the golden years are no longer active, and new folks are not interested to take over because alternatives exist now that require much less effort. Once you are below a certain critical mass of functioning network, an extra link that breaks is no longer considered top priority to repair (as it was before).

10-15 years ago a packet radio network was two things: a nice experiment using radio, and a novelty in transporting messages from person to person. Now, it is only a radio experiment. Apparently that is not enough to sustain the network (which requires a lot of systems to be maintained in good working order). Thus the network breaks apart in local activity cells linked by other means than radio.

You could also run back-to-back ethernet controllers,
in case you can't convince the pipe driver to talk to JNOS.

I once had a local "hub" station that forwarded BBS traffic to a net/rom node on 145.01; the operator was either ignorant or malicious, or both, and set his TXDelay to something in excess of 500mS, AxFrame to 4, and an AckTimer of 1 second. Since the net/rom forwarded on the same frequency, the Acks were invariably delayed much longer than the timer was willing to wait.

If I listened to the channel, the 500mS+ TXD followed by a relatively short payload, repeating what seemed endlessly, was annoying as Hell.

Obviously, it severely broke the channel, which seemed to come as an amusement to the operator.

I recently purchased a used AEA DSP-2232 TNC/Modem. The unit acts strange in that the tuning 'bar' graphs fluctuate wildly EVEN WHEN NO RADIO OR COMPUTER HOOKUP is present!

Needless to say, the ability to tune in a signal using these meters is hopeless. However, the TNC does appear to operate correctly in generating digital signals, and reception of signals is possible if tuning by ear is managed (depends on band/mode, etc.)

Does anyone have any insights into the operation of the tuning indicators? Iis there a likelihood that additional parts of the DEmodulator circuits are bad, thus generating noise that the meters are 'hearing'?

Advise greatly appreciated!

Greg

```

This is a DSP unit. DSP stands for Digital Signal Processing.

That means that there are no demodulator circuits. Demodulation is done in software. The signal is converted from analog to digital right at the radio input, and then processed using clever software only very few people on earth can understand, let alone develop...

Hello Greg,

It is quite normal to see flickers in the tuning bars of DSP (and non-DSP) TNCs with no signal applied. This is just odd bits of noise the DSP mathematics produce while trying to filter. As soon as a signal is applied the unit will work properly.

If the display is fluctuating "wildly", then you may have other problems. Be sure you have a well regulated supply of at least an amp and a half.

There are no internal adjustments to change the display fluctations.

In the very first few DSP-2232's AEA produced (less than 100 I believe) there was a factory mod that cut a couple of traces and added a component or two to fix a noise problem. You may have one of these.

All the best,

John N�ISL

...And with nothing connected, there very well may be a "signal" received on the input. What happens if you ground the input? Without grounding and no other connection, your unit could be picking up noise from other electronic devices nearby, distant lightning, or even galactic background noise!

I have a PTC-II multimode controller. Just for interest, I want to use it to look at HF 300 baud packet stations. The handbook says I need a TSR programme called TFX which is on the supplied discs. No such programme appears on my discs, nor can I seem to find it anywhere.

Can anyone please either send me a copy by e-mail or point me at somewhere from which I can obtain a copy.

Many thanks.

Allan

from this group (April 10):

This is NOT true. READ the PTC II manual. 300 baud packet operation is possible with the PTC II. I have done it!! You need a program called TFX 2.8 available from www.nordlink.org. (Click on FIRMWARE even though TFX 2.8 really isn't firmware. It runs on your PC). You will also need a good terminal program that operates in the WA8DED hostmode. Many Hams use Grafik Packet available from http://www.higgy.de/fert_e.htm

The PTC II manual provides all the details to make 300 baud HF packet possible with the PTC II. (In fact the TFX 2.8 program does ALL the hard work. The PTC II just acts like a VERY simple modem).

Michael

Here is a place where you can download a packet program that will use the sound card of your computer. Just hook the audio out of you rreceiver to the aduio in of the sound card.

http://www.muenster.de/%7Ewelp/sb.htm

I don't really know what you mean 'with everything' . Packet is it, just packet from the TNC and if you want anything very special then you have to have softwear to do it.

Wouldn't it be just a little more likely that the 'noise' picked up by the
unit is generated internally in the op-amps in the analog audio chain?

Dear All,

I have just inherited a Model 15 teletype and I'm interested in exploring if
it can be made to work on RTTY. Can someone who is running a Model 15 (or
someone who is knowledgeable about one) get in touch with me to discuss how
I can get this going?

Thanks very much for any help you can give me!

73,

That's possible, but a PROPERLY engineered device would account for its OWN
noise and disregard it. I suspect it can more readily pick up the noise from
other equipment than itself because of that.

I'm looking for good PSK31 contest software. My problem is more on the logging and dupe checking part of the software. It seems all the current PSK31 packages I've tried out there really fall down on this part. Do people run PSK31 *and* contest logging software at the same time? Any recommendations?

Interesting concept, but it does not adequately take into account physics.

Certainly, a good designer would take steps to insure that self-generated noise does not cause aberrant operation of a system, but that's not the same as 'disregarding' noise.

In particular, determining what 'correct' behavior is across unusual conditions - such as operating with no input signal - is not always trivial.

In this specific case, we're talking about a frequency discriminator display on a TNC. Very small amounts of broadband noise generated by thermal influences on semiconductor junctions are likely to create a 'noisy' display unless some mechanism is provided to 'squelch' the display when no input signal is present. Since the display is usless when no signal is present, there's no sound reason to over-engineer the device to ignore it.

So, once again, I suggest that internally-generated noise is likely the culprit. When you get a chance to do some analog design, you'll find this is true.

If it was easy as this, I could have flirted with the really cute girl in my 12th-grade physics class more and spent less time learning the laws of nature.

If it is in good condition, it will probably work.  The problem is that
they are so old that parts are hard to come by.  Most people operating
RTTY are using computers (which don't even have green keys).  My last
Model 15 went into a dumpster in 1984!  You will need a terminal unit
to interface between your radio and the Model 15.  There are many
designs in old issues of QST and RTTY Journal from the 1950s through
early 1980s.  Back issues of both of these are available on CD-ROM.
ARRL has a searchable QST index (for members only) on
http://www.arrl.org (RTTY journal does not, but you might take a look
at the links from http://www.rttyjournal.com.)

John,

The mod was for units through 500. (DSP-1232 through 38) I still
have the sheet in the back of my manual. I moded the unit before I
even put it into service, so I can't comment on the usefulness.

Hey all!

I'm a college student in upstate NY. Want to do a signal processing project using the BCD data stream from WWVB (broadcast on 60KHz) out of Ft. Collins Col., problem is that my rig blew up during a lightning strike, and now I have no way to receive the signal. I was wondering if I could talk any of you guys in or near Colorado into recording a few minutes (3 to 5) of clean WWVB signal and emailing it to me at tannerpa@clarkson.edu or p_a_tanner@hotmail.com . WWVB has no vocal announcement, it's only AM DSB-SC modulation carrying a PWM BCD data stream. You'll know you got it if you hear a pulse every second. I've tried contacting WWV by telephone, as it broadcasts both vocal announcement and BCD data, however the telephone signal is the vocal announcement only. Best results probably at night. I'll send $20 to the first person who sends me a useable wav file, for their time and effort, and to express my appreciation!

73,

Pat Tanner

Look at www.rtty.com for some good info on the old tt. For starters you can look at the coils of wire in the printer and see if they are inseries or parallel. If series then need 20 ma to work and parallel needs 60 ma to work.. This is usually by a power suply of about 100 to 200 volts DC and a big series resistor of abotu 2500 ohms at 10 or 15 watts for the 60 ma supply, forgot the 20 ma value. This goes in series with the coils and keyboard contacts. You should then be able to type locally. The machine will run wide open if the loop is broken and just he moter and a shaft will turn if the coils have the current going to them.

Check out www.rtty.com  Model 15's and 28's are very common currently in use
by many.  I have several 28's in use now...

Hi David:

Imagine...

It is conceivable that software could do a better job without the operators being involved? If the "contest software" were fully integrated into the PSK31 software, then it could all be automated.

73,

You may want to check out the following:

RCKRtty at http://www.rckrtty.de/

WRITELOG at http://www.rckrtty.de/

Both programs support PSK31 and RTTY contesting.

But like MOST contest programs, you must pay for them. Don't expect a free lunch.

Rob

Derek,

The TTY folks can be found on the Greenkeys mailing list. You can subscribe at http://www.qth.net/ Several of them have Model 15's on the air.

Know what, Zoran; I give up.

There are people who are thoughtless drones, no matter how hard you hit them with a hammer. Charles is one of them. He doesn't care about usenet and he doesn't care about other people's interest in this fabulous medium. He sees it as the perfect place to run his adv^H^H^HSPAM and think that it's just great.

He behaves like the simplex idiot who is too stupid to grasp the concept of split operating. In that vein he is unable to grasp the concept of a text based, ad-free and multicultural environment that has been designed to discuss ideas, not to promote ridiculously bad designed and contentless webpages. He laughs at people who think that his fullquotes, referenceless drivels are a waste of conceptual bandwidth.

Let him have it his way. Let him be happy in his dysfunctional way of not understanding what 2-way communication at its best can be. Let's leave him alone and pray for www.usenet2.org where mindless people like him will never have a place.

```

I was wondering what the veterans of SSTV think regarding how much power is needed for SSTV. I currently have an Icom 745 (100 watts), MMSSTV software (seems very nice, and the price was right - free!), and a V-dipole antenna for 20, 15, and 10m. I am receiving pictures fine, but am worried about transmissions. I don't want to just broadcast something that looks like static.

Do I need a linear amplifier to get decent results, and if so, how much power output is reasonable for SSTV?

73s

Michael

Hi Michael,
In all honesty propagation has more to do with it than power, in my view :) I run a stock unit, with a typical yagi up about 40 ft and have worked the world. Don't worry. The trick is to get on the air and try. Good luck.
73,
Pete

Log Windows 3.07.33 released!

Update adds TS-2000 and FT-817 radio support and support for Nova Satellite program

Muscle Shoals, Alabama. April 2, 2001: Creative Services Software announced that version 3.07.33 of the popular logging program Log Windows has been released. The release includes fixes for the FT-990 with DX Spotting, as well as support for Kenwood's new TS-2000 and the new Yaesu FT-817 QRP radio.

One of the major advantages of using it with the TS-2000 is that it supports the Packet Cluster Tuning Data feature, which allows you to be connected to one cluster with your TNC or internet connection and use the TNC in the TS-2000 with Packet Cluster Tune turned on to get DX spots from both clusters at the same time. Many Dxers will be able to use this feature to help add to their DXCC, WAS and other award totals, as well as during contests.

It also has the new features of the 3.07.XX releases:

- Support for Top Ten devices band decoder
- Support for Alinco DX-77
- Direct support for the Icom IC-706 MKII
- Stop rotor function for HYGAIN and Sartek rotors
- Browse function for PSK mode (in search options)
- Added option for W4CSS parallel interface (5th message with MFJ Voice Keyer)
- Direct Support for the Rotor-EZ
- Added Grayline windows display.
- Added DXCC2000 reporting support.
- Telnet DX Cluster Access
- IOTA Support
- WinQSL QSL Manager Support
- QSLMaker 2.3 QSL Printing Program Support
- Full ADIF support
- Support for the W9XT CW keyer
- Support for the K8CC parallel port interface

The product retails for $69.95 and upgrades from release 3.06.15 or earlier is $40.00. Those who have purchased version 3.06.50 or greater will get this upgrade free. It also appears on the Digital Trio CD. It is available from dealers around the world, as well as direct from CSS.

Log Windows is owned by SCO, Inc and is maintained by Creative Services Software.

Creative Services Software is at http://www.cssincorp.com
The Log Windows homepage is at http://www.logwindows.com

Windows, Windows 95, Windows 98, Windows Me, Windows NT and Windows 2000 are Registered Trademarks of Microsoft Corporation.

He doesn't care about usenet and he doesn't care about other people's interest in this fabulous medium. He sees it as the perfect place to run his adv^H^H^HSPAM and think that it's just great.

To each his own, Peter. Spam will be with us no matter what, and probably the best way to deal with it is a filter. I tend to not use filters in newsgroups because, to quote a friend of mine who does the same: "I like to have the latest figure of the index of stupidity".

Hello Folks,

I seem to be having a problem with my TNC cabling. Previously I made a cable for my IC-746 and was using it without problems on packet and aprs.

Last night I put together a cable for my htx-242. I have double and triple checked it. This is what happens.

The receive light stays on for long periods, even when the squelch is not broken. Of course this interferes with my transmissions. I do receive data correctly, and can transmit when the rx line finally decides to turn off.

I'm confident that it is wired correctly, and can't figure out what the problem is. Could it be a DC voltage on the speaker line?, that is holding the receive open. I'm considering putting a cap in series.

Has anyone else had this problem, I'm sure that manly others have used this radio for packet. BTW the radio is only a week old, newly purchased.

Please reply to ve4tjr@rac.ca as, I don't check the newsgroups regularly enough.

Michael,

Most of the time, if the other people can hear you well enough to carry on a conversation, they will receive an average to good picture from you. If you can talk to them comfortably, you'll do fine with a picture. Of course, a little bit of power never hurts.

'Doc

Does anyone have a frequency deviation meter that they use to set up 9600 packet levels?

I've seen the Marconi TF791D offered in the $175 range and think it might be handy for setting up 70 cm deviations for accurate satellite station operation. Anyone got one?

If so, what is your opinion of the unit, and could a 'reparable' one be worth $75?

Any info on deviation meters would be appreciated.

Greetings...

I know I posted a similar ad earlier, but the right deal hasn't come along yet. I have a one month old Gateway 5300 Intel Celeron 650 mhZ Laptop with THE WORKS! Includes CD-ROM drive, 3.5" floppy, 6 Gig HD, 64 mb RAM, 14.1" TFT color display, 56K modem built in, Viking Cellular modem, 2 empty PCMCIA slots, 1 USB port, new Targus carrying case, and loads of software, including Microsoft Office 2001 with Streets and Trips 2001, etc. I am in desperate need of a good amp, as mine went south this past week. Over $1,600 invested in the laptop. I would love to trade for a decent HF rig and an old SB-220, as long as tubes are full output and in perfect working order. Will consider other trades. I have the UPS bill of lading to show a ship date of Feb. 20th. PLEASE e-mail with offers. I need to be QRO again!

I don't have an opinion on the Marconi unit's value, but if you want to roll
up your sleeves a bit, you can do surprisingly accurate deviation measurement
with a slightly modified FM receiver (a scanner will do nicely) and a cheap
oscilloscope.

I have a document at http://www.febo.com/layer-one/transmit.html that
describes how to do this (about 2/3 of the way down, after lots of discussion
about 1200 baud deviation issues).  Although the article focuses on 1200 baud,
the test setup described will work for 9600 as well, unless the receiver's IF
filter is very tight -- using a cheap receiver like a scanner may be an
advantage, since they tend not to have narrow filters.

I've got one, only paid $50 for it though. It is trickier to use than it looks.
I think you're better off using the bessel null method to set deviation.

Can anyone help? I have SV2AGW's program working with my soundcard. It sends and receives fine, but as soon as I try to connect to another station it disconnects as soon as it becomes connected. My brother set his system up separately and his is the same. I am using agwterm as the packet program.

Any advice appreciated.

Is it an old KAM with 8.0 or a KAM Plus? If it has the older white plastic
case, no more than $100.00 to $150.00. If it is the real cool KAM Plus
with the black metal case, you should get $250.00 easy!

The KAM Plus is no longer made. It was the best ALL MODE TNC put out
by Kantronics (becasue it is a dual port TNC!). There latest KAM 98

is real cool but only operates one port at a time. They go for just
under $400.00!

I was ready to pay $300.00 for the latest KAM Plus w/ 8.0 firmware.
But, I wanted the good looking black one. I found one for $245.00!

Dino

>What is a good selling price for a Kam 8.0.. No cables(do have some
>software programs for it)? Thank you. Louis/W4NRG

Hello, All!

TrueTTY 1.75 was published at http://www.dxsoft.com

TrueTTY 1.75
Program for amateur radio digital communications via a sound card.
Supported modes are RTTY (Baudot code), ASCII (7 or 8 bits), PSK31
(BPSK and QPSK) and AMTOR-FEC (SITOR-B, NAVTEX). SELFEC SITOR
decoding is possible also. No additional hardware required - you need
only transceiver and computer (5x86-133, Pentium-75 or better) with a
sound card. Optionally you can use simple circuit fo PTT-control. It
make fast and convenient frequence control, has a lot macros for
transmitting.
Can cooperate with RZ4AG AAlog logger.

73!
Sergei

I have just had an email from Andy in Slovenia, asking about AX.25 driver support under FreeBSD. He says he will write his own if nothing already exists, but I'm sure someone must have trodden this path before.

If you know where he can find suitable drivers, please email him direct (he does not have access to Usenet newsgroups).

His address: Aleksander (Andy) Rozman <aleksander.rozman@hermes.si>

Thanks.

I have been listening for about a week (admittedly the bands haven't been
the greatest), but have not found anyone using MFSK16.  It is purported to
```

be better for DX than PSK31, according to an article in QST magazine (January 2001). I tried checking the bands for it using HamScope (great program by the way!) and IZ8BLY's Stream, but no one there. Anyone using this mode yet? If so, how's it working?

Regards,

Michael Adams

There's a fair amount of activity out there on MFSK16, look around 14.080 or 3.580. And if you don't hear anyone you shouldn't have too much trouble scaring up a contact by calling CQ yourself.

MFSK is indeed much superior to PSK31 under poor band conditions, really no comparison. I have switched to MFSK16 from PSK31 several times due to poor band conditions only to have copy go up to 100% after switching to MFSK (vs. less than 50% copy on PSK under the same conditions). I don't even bother with PSK31 anymore. MFSK is also a great QRP mode, of course... I have obtained excellent results with a dipole and just a few watts. Try it, you won't go back..!

73,

- Seth   N6SQ

-----BEGIN PGP SIGNED MESSAGE-----
Hash: SHA1

Hi all, I've been fiddling with setting up a NOS packet system and am at an impasse. I've got my system configured for AX25, NET/ROM & TCP/IP, and can do an ax25 connect to the local node as if I were just using a terminal program.

I've tried a NET/ROM connect and it shows the 'Trying xyz @ xyz'

message and the session info shows 'Conn Pending', but it never
seems to complete the connect and eventually times out.

Any ideas on what I'm missing here? I'm guessing a successful
connect should put me into the BBS of the system I'm trying to connect
to ('info' command on that system shows that is what the NET/ROM ID
is.)

Once I get this working, my next challenge will be forwarding, any
pitfalls I ought to be aware of for that? Appreciate any assistance
you can send my way.

```

A Google search shows plenty of talk about it, but not much action.

There is a lot more to it than drivers -- you need drivers for the hardware (soundmodem, baycom, kiss, etc), plus the protocol stack (hdlc, ax.25, TCP/IP encapsulation etc).

Just run Linux.

I have been using it for months.  Great mode.  Had QSOs on 80, 20, 15 and
10.  20 is the most active.

Can anyone please tell me where I can download software to enable me to copy
300 baud HF packet signals with my SCS PTC-II multimode controller?  I am using
```

a PC with Windows 98.

Thanks

Allan

I believe running 300 baud HF packet with the PTC-II would require new
firmware for the PTC-II or a different internal packet modem. I don't
think there is anything like that available. Virtually all the PTC-II
software is available at http://www.scs-ptc.com

I believe running 300 baud HF packet with the PTC-II would require new
firmware for the PTC-II or a different internal packet modem. I don't
think there is anything like that available.  Virtually all the PTC-II
software is available at http://www.scs-ptc.com

What version NOS are you using? There are quite a few out there. I use JNOS, ver 1.11d. Set your system to trace to a file... ie..

```
trace [portname] 311 portname.trc
```

This will write all port activity to the file portname.trc, which you may use any editor to view. The questions I have, does an initial AX25 connection go through and complete, once an AX25 connection is complete, does a NETROM connect request get sent? When at the command line, enter

```
netrom route info
```

You should get a list of nodes known by your NOS system. Another possibility would be conflicting routes, say two ports providing the same information. I assume you have a netrom interface attached.. ie...

```
netrom interface [ax25 portname] quality minquality
```

OK, quality is the level which your port will assign to the nodes which you can see direct, minquality is the level you set as the lowest you wish to have in your netrom routes. Please be sure that minquality is below the port quality, otherwise you'll not see any nodes on your list. There are many other netrom variables that will determine the behavior of your netrom system.

> Hi all, I've been fiddling with setting up a NOS packet system and am at an impasse. I've got my system configured for AX25, NET/ROM & TCP/IP, and can do an ax25 connect to the local node as if I were just

> using a terminal program.

Hi All
Have had a lot of questions on auction below.
C156 is FM 2mtre handheld with wide band coverage.
http://page.auctions.yahoo.com/uk/auction/50643541

Q: Range of Reciever
A: Frequency on transmit is normal 2mtrs, frequency on rx is approx
100mhz-174 mhz yes I know it will go above this but the pll unlocks so I
cant say it will.
Q:Power output
A:Up to 5 watts
Q: reserve price,
A: Well there isnt one I have just bought a new rig so its sat there looking
at me so I may as well sell it.(the price bidded at the time of posting was
�50 the only bidder)

Other than the above
Transciever includes:
2 Nicad battery packs CN156 (they push into the base and form part of the case, so quick change over)
1 Charger for above nicads
1 Nicad case the same shape as CN156 but put your own nicad batteries in (as came standard with C156)
1 fused connector lead for connecting C156 to 12v power supply
1 speaker mic CMP127
1 Manual
and Original Box in new condition
1 original rubber duck antenna
postage will be charged at cost (probably about 4-5 pounds)

Think this covers everything

I once saw JNOS in a Linux environment and interfacing through a pipe.

Maybe one can compile JNOS in FreeBSD and use this a interface for a
KISS-tnc. TCP/IP connection with the system can be made by a named-pipe.

Indeed - my ISP filtered out the original post because of the
cross-posting, I guess.

And my newsreader won't let me post to all those groups, either!

The logic that any good cause merits totally off-charter cross posting
is naively attractive, but quite stupid if UseNet is not to be totally
clogged with such stuff.

> This doesn't really solve the problem. We need a lookup server
> that it doesn't matter where your email or eqsl server is you
> can find it.

The point I was getting at is the following ...

There are lots of services like arrl.org. Some of them allow you to enter more information than just your username (callsign). So the needed information can all be stored there, and queried via http. The format in which the information is returned is different for each server, and none that I know of supplies the XML that defines the fields in the returned data. Thus it is "hard" to automate such a query. It can be done of course, see www.yodlee.com for a very good example of pulling together data from many web sites that is all related to a single key (your login). Yodlee is designed to aggregate financial data, but the concept would work for any kind of data.

So what does all my babbling mean, anyway?

The technical part of this problem is easy to solve. There are many ways to solve it. Before I retired, I designed web driven database systems that did these things. It's all pretty easy, once you decide exactly what is wanted. So first thing is to figure out the requirements. Then figure out what resources are available to implement (multiple servers with Oracle and Cold Fusion available? Linux with mysql? windows 2000 and sql server? flat files and CGI to run on "any OS"? do our own ISAM?).

But before any of the above become interesting excercises (other than just babbling on some newsgroups) we need to know if hams are interested in such a thing, and if they would use it. In essence, a business plan is required.

With a convincing business plan, I would guess that a bunch of volunteer software folks would build it for free.

I had something slightly different in mind. If this kind of solution
were adopted, then the way you would "sign up for QSL service"
would be to register your callsign at the ARRL service, and
supply some specific additional information that could be
automatically retrieved from their server. Infomation like
your certificate, what logging software you used, etc.

Just an example of how things could be done.

net-fridge might be a better example.
Don't know if it is still online though, their business model
was based on banner ads ...

> so perhaps forget about LDAP.

LDAP is *exactly* the solution intended for this kind of problem. The
library may be a little daunting to get started with, but all new mainstream
directory service APIs and systems will be leveraging LDAP, unless something
remarkably significant comes along.

DNS is a much older kind of specialized directory service, and works very well
for what it is intended to do and has generally been well-implemented for
what it is usually used for. I'm not so certain that twisting DNS to do callsign-lookup
would be as satisfactory.

Certainly, if LDAP itself is too heavy-weight for what you want, an alternative is build a proxy that leverages the advantages of LDAP while providing a light-weight implementation of callsign lookup.

The generality of LDAP also bring complexity, life just seems to work that way. This is why I suggest building an ASP-style proxy which makes us of the 'standard' off-the-sheld LDAP infrastructure. You gain all the advantages of LDAP without exposing the end-user clients to the complexity, and there can be a great many proxies.

Using proxies makes it easy to address #2; each kind of proxy can export any desired API appropriate to the class of client. It effectively decouples how the data is stored and managed from the specific API, thus permitting competition where it makes sense.

However, the technology of how a database is implemented is virtually irrelevant when discussing the intellectual property (IP) issue (#1) and the marketing/promotion of the database (#3). Initiatives like UDDI probably ease #3, or at least offer a reasonable option. Issue #1 is really two issues; who owns and controls the data, and who hosts the data. The two are separate though often confused as one.

Dana

The main issue with this, in my view, is the complexity of setting up
the LDAP servers, and the complexity of creating a useful API.

Been involved in both ... is a lot of work.

Anyway ... I'm not convinced the market exists.

We are in agreement about the ASP style proxy.
Seems to me the best way to do the API.
I would tend to think http with the interface defined with XML.
API definition needs to come after the requirements though.

Exactly.
Data representation in the database decoupled from the data
representation in the API ... most important.

Needs to be some standard API, or several of them
if there is a requirement for more than one.

Agree. Any database, any API ... you still need to solve the various
"political and marketting problems" first. Otherwise there is little sense
in spending the work to create the various "how it's done" standards involved.

From the above ideas, it would make sense to split the "what to do" and
"how to do it" issues. They can be worked on by different people.

Also agree with your point to split issue #1 into it's constituant issues.
Different problems, can have different kinds of solutions.

Gee ... now that we know how to do it ... what next? (grin).

Darryl Wagoner - WA1GON <darryl_NOSPAM@shecora.com> wrote:
>LDAP may work but it is a very heavy library.

LDAP means: Lightweight Directory Access Protocol.

It is supposed to be a very lightweight approach as compared to other protocols and APIs.

And after you have studied it a little, or use a somewhat higer level (e.g. like provided in PHP), it isn't that hard.

I have set up an LDAP server that stores employee information for the company I work for, and some access routines in PHP and Perl that are used on the Intranet website, and after some study of the basics it was quite simple.

For this purpose, you don't have to use the libraries!
Learning to use the resolver libraries would not be easy either...

Hi there !

anyone have an idea where i can order TCXO's in very small (3-5 pcs)
quantities for an acceptable price ?

Thanks

Dominik

San Diego has a 56k Node on Otay and I have three of them sitting here in my
garage (one older kit type and two newer modems with MMT-432 Transverters).

Hank: Take a look at http://www.wa4dsy.net

Hello everyone.
OH/KB9YXM here.
I wanted to let everyone know about the Finnish Club station OH8TA's
Expedition to IOTA island Hailuto in the Gulf of Bothnia off of the Finnish
coast near Oulu. We will be operating for three days from the university of
Oulu's marine research station on the island.
We will be operating on HF VHF and UHF. The frequency for 6 meters will be
50.110USB. For other bands and frequencies please send an email message to
oh8ta@oulu.fi
Operating conditions for 6 meters will be a Cushcraft 3 element Yagi, Yaesu
ATAS-100 with GP and counterpoise, Yaesu FT-100@100-500Watts. The Yagi and
ATAS-100 will be mounted atop the lighthouse station at 30-35 meters above
sea-leval.
The dates will be April 6-8.

KB9YXM is a US operator currently living in Finland and very active
on 50Mhz and above.
QSL to KB9YXM will be 100% via OH8TA

The most complete archive of linux ham radio applications is at
http://radio.linux.org.au

There are four programs listed there which are available for PSK31 (of
these I prefer gpsk), and a wide variety of other programs for digital
radio, some using soundcards, and various ones for particular hardware
and TNCs.

Note that when you arrive at the page it will only show recent new
entries in the database.  You need to click on the button showing the
categories of programs available in order to access the full database.
(I personally don't think the interface to the database is very well
done, but once you get into it there is a lot there).

Chris

Hi Marco.
I notice you have BPQETHER as (W0RLI?).
That is probably my BPQENET package, but a very old one.
The current version can always be found on my web site.

Better to put a link to it rather than copy an old version ... (smile)

I'm having a problem with a friends computer, (IBM Clone, Intel PII-400, Win98SE, 128megs ram) that I am trying to get WinAPRS & Precision Mapping running on. I have had success installing the same setup in other computers with no problems what so ever. When I run the batch file from the pmapocx.zip file so WinAPRS will recognize the Precision Mapping files, RegSvr32 reports an error. WinAPRS runs OK, but doesn't know that Precision Mapping files are there. The error that RegSvr32 reports is:

```
RegSvr32
LoadLibrary("MAPOCX.OCX") failed.
GetLastError returns 0x00000002
```

The batch file is setup correctly, the files got copied OK, Precision Mapping files are in the correct directory, pmap30, in the root directory of the C drive. Has all the correct directories under it, and all the proper files in them. I've closed any and all other programs that were running, but it always comes up with that error every time. I've tried everything I can think of, different files from the other computers, running from a DOS window, etc, but nothing works. Can the information be entered into the registry manually? If so, what and where would be put into the registry. Any help would be much appreciated.

Please post any replies to this newsgroup.

Thanks for your time,

DB

I'm trying to set up a terminal unit with a Creed 7E teleprinter as a newcommer to RTTY. I have now a second hand RADPRINT terminal unit which has a 5 pin DIN jack on the back marked TELEPRINTER, and this seems to carry the necessary 80V when the unit is idle. Is anyone familiar with the unit enough to help me figure out what the other sockets on the back are for!

AVOID TRIPOD WEB SERVICES

Last weekend, Tripod removed all of my web pages for "violating their acceptable use policies."

I could not figure what I had done, but I'm not
one to whine and I moved my pages to:

http://www.qsl.net/k7on/

Now, I receive the following:

Date: Tue, 20 Mar 2001 04:38:43 -0500 (EST)
From: membership@tripod.com
X-Authentication-Warning: bos-uhaul1.tripod.com: web set sender to
membership@tripod.com using -f
To: k7on@earthlink.net
subject: Your Tripod Membership

Dear Tripod Member,
We apologize for the removal of your site over the weekend. Due to some
technical errors, we mistakenly removed several member sites and are in
the process of restoring them. We did not single out you or your site,
please accept our apologies, your site has now been restored.

Sincerely,
The Tripod Team

Ummmm........... gee looks like the people working at Tripod are human
after all and make mistakes just like you and me. At least they were men
enough to apologize and make things right. Whar's your beef or do you just
like to whine and moan.

Panzer

Sounds to me that it was a "sign" for you to move your pages to QSL.net.
That's where I have mine, and have been very happy there. I'd pass on
Tripod for the future, if it were me.

It is easy to solve badly.   I not sure if it is as easy to solve
well. The simple solution is to hook a web server up
to a database and start promoting it. But that is what
QRZ.COM and Buckmaster.net is doing.   The problem
with these services is there isn't an API into the database. I think this is

important.   These folks sales CD with this information on it. That
in itself would lead me to believe that there is a market for it.

> many ways to solve it. Before I retired, I designed web driven

> CGI to run on "any OS"? do our own ISAM?).

Yes I agree this is a good first step. Here is what I believe
the requirements should be:

1. Easy open source API interface. It should be easy for
every software vendor to add it to there feature set.

2. There should be replication around the Internet.   Information
should be pushed out to other servers.

3. The backend servers should use open source software as much
as possible. The backend servers must at least use a open standard
for data exchange.

4. Some type of anti-spam protection. Not sure how to do this one,
but I do have some ideas. We don't want Heath downloading
all the emails and spaming us. HI HI

5. A secure way to update one's own info.

That is all I can think of now.

Agree in general with those five requirements. By "easy to solve"
I actually meant "I've done something almost exactly like this, more
than once, and found it easy to accomplish." Posted some specific
ideas elsewhere in the thread.

I am thinking of adding a second soundcard to my Win 98PC for the digital
modes.  Any advice or concerns?

Randy Ka4nma

My dad always told me, "You get what you pay for." I guess since Tripod is free, you can't complain. I keep several pages on Tripod...never had a bit of trouble. I also keep every file on Tripod's site on my computer just in case there is ever a problem. Haven't had to use the backup plan yet and I've been with Tripod for about 3 years now. I guess it's a "sign" you should keep backup files of everything on your computer anyway. You HAVE been doing that haven't you? Ever "lost" anything on your computer at home?

I'm curious about the Universal decoder boxes (M5000, M6000, M7000, etc).
I know they have printer and monitor ports on them, but what about a serial connection?

Seems like you would want to hook it up to your PC instead of spewing onto paper.

Anybody know?

Regards,

Keith

The M7000 and I suspect the others have a serial port. Its wired to a mil spec so the pinouts differ from a standard db25. I put my own db9 on the M7000 and wired it correctly. If memory is correct Scancat offered a adapter plug and I'm sure it would not be difficult to roll your own. The manual identifies the pinout.

How do you like the M7000? I'm interested in getting a decoder of some sort.
Would I be better off with one of the M*000 series, or are there better
choices today?

Thanks,

Keith
